# **General Information**

## INTRODUCTION

This service manual has been developed to provide the service technician with the basic understanding of the PSI certified fuel and emission systems for their GM engine line. This manual should be used in conjunction with the base engine manual and the OEM service manual when diagnosing fuel or electrical problems.

#### SERVICING YOUR EMISSIONS CERTIFIED ENGINE

Any maintenance and repair should be performed by trained and experienced service technicians. Proper tools and equipment should be used to prevent injury to the servicing technician and damage to the vehicle or components. Service repairs should always be performed in a safe environment and the technician should always wear protective clothing to prevent injury.

# FUEL QUALITY

PSI LPG engines and fuel systems are designed to operate on HD-5 or HD-10 specification LPG fuel. Fuel other than HD-5 or HD-10 may cause harm to the engine's emission control system and a warranty claim may be denied on this basis if operators can readily find the proper fuel. Gasoline engines should use 87 octane or higher. E85 fuel is not permitted for use in the gasoline engine. Use of any other fuel may result in your engine no longer operating in compliance with CARB or EPA emissions requirements.

# FUEL SYSTEM CAUTIONS

# CAUTION

Do not smoke, carry lighted tobacco or use a lighted flame of any type when working on or near any fuel related component. Highly flammable air-fuel mixtures may be present and can be ignited causing personal injury

# CAUTION

Do not allow LPG to contact the skin. LPG is stored in the fuel tank as a liquid. When LPG contacts the atmosphere, it immediately expands into a gas, resulting in a refrigeration effect that can cause severe burns to the skin.

# CAUTION

Do not allow LPG to accumulate in areas below ground level such as in a service pit or underground ventilation systems. LPG is heavier than air and can displace oxygen, creating a dangerous condition

# CAUTION

Do not make repairs to the LPG fuel system if you are not familiar with or trained to service LPG fuel system. Contact the dealer who sold you the vehicle to locate a repair facility with trained technicians to repair your fuel system

### WARNINGS, CAUTIONS AND NOTES

This manual contains several different Warnings, Cautions, and Notes that must be observed to prevent personal injury and or damage to the vehicle, the fuel system or personal property.

A "WARNING" is an advisement that by performing a process or procedure listed in this manual improperly may result in serious bodily injury, death and/or serious damage to the vehicle or property.

# PROPER USE OF THIS SERVICE MANUAL, TOOLS AND EQUIPMENT

To reduce the potential for injury to the technician or others and to reduce damage to the equipment during service repairs the technician should observe the following steps:

- The service procedures defined in this manual, when followed, have been found to be a safe and efficient process to repair the fuel system. In some cases special tools may be required to perform the necessary procedures to safely remove and replace a failed component.
- The installed PSI fuel system has been certified with the Environmental Protection Agency (EPA) and complies with the regulation in effect at the time of certification. When servicing the fuel and emission control system you should follow all the recommended service and repair procedures to insure the fuel and emissions system is operating as designed and certified. Purposely or knowingly defeating or disabling any part or the fuel and emission system may be in violation of the anti-tampering provision of the EPA's Clean Air Act.
- Tools identified in this manual with the prefix "J" or "BT" can be procured through SPX in Warren, Michigan.
- Other special tools identified in this manual can be acquired through the equipment OEM or PSI.

#### **IMPORTANT**

It is important to remember that there may be a combination of Metric and Imperial fasteners used in the installation of the PSI fuel system. Check to insure proper fit when using a socket or wrench on any fastener to prevent damage to the component being removed or injury from "slipping off" the fastener.

# WARNING

Always leak check any fuel system connection after servicing! Use an electronic leak detector and/or a liquid leak detection solution. Failure to leak check could result in serious bodily injury, death, or serious property damage.

# Maintenance

#### MAINTENANCE

The maintenance of an engine and related components are critical to its operating performance and lifespan. Industrial engines operate in environments that often include hot and cold temperatures and extreme dust. The recommended maintenance schedule is listed in this section, however, environmental operating conditions and additional installed equipment may require more frequent inspection and servicing. The owner and/or service agent should review the operating conditions of the equipment to determine the inspection and maintenance intervals.

# WARNING

When performing maintenance on the engine, turn the ignition OFF and disconnect the battery negative cable to avoid injury or damage to the engine.

The engine installed in this equipment uses a drive belt that drives the water pump, alternator and additional pumps or devices. It is important to note that the drive belt is an integral part of the cooling and charging system and should be inspected according to the maintenance schedule in this section. When inspecting the belts check for:

- Cracks
- Chunking of the belt
- Splits
- Material hanging loose from the belt
- Glazing, hardening

If any of these conditions exist the belt should be replaced with the recommended OEM replacement belt.

#### SERPENTINE BELT SYSTEM

Serpentine belts utilize a spring-loaded tensioner to keep the belt properly adjusted. Serpentine belts should be checked according to the maintenance schedule in this section.

#### **IMPORTANT:**

The use of "belt dressing" or "anti-slipping

agents" on belts is not recommended.

#### **COOLING SYSTEM**

It is important that the cooling system of the engine be maintained properly to ensure proper performance and longevity.

Do not remove the cooling system pressure cap (radiator cap) when the engine is hot. Allow the engine to cool and then remove the cap slowly to allow pressure to vent. Hot coolant under pressure may discharge violently.

Note that there may be an LPG vaporizer connected to the cooling system and the fuel system may be adversely affected by low coolant levels and restricted or plugged radiator cores. Therefore, the cooling system must be maintained according to the recommend maintenance schedule in this section and also include:

- The regular removal of dust, dirt and debris from the radiator core and fan shroud.
- Inspection of coolant hoses and components for leaks, especially at the radiator hose connections. Tighten hose clamps if necessary.
- Check radiator hoses for swelling, separation, hardening, cracks or any type of deterioration. If any of these conditions exist the hose should be replaced with a recommended OEM replacement part.
- Inspect the radiator cap to ensure proper sealing.

### COOLANT

The engine manufacturer recommends the cooling system be filled with a 50/50 mixture of antifreeze and water. The use of DexCool "Long Life" type coolant is required. This antifreeze is typically a bright orange in color and should meet the requirements issued by PSI. Coolant should have a minimum boiling point of 300F (149c) and a freezing point no higher than -34F (-37c).

Do not add plain water. Replace coolant per the recommended schedule.

#### **IMPORTANT:**

The manufacturers of the engine and fuel system do not recommend the use of "stop leak" additives to repair leaks in the cooling system. If leaks are present the radiator should be removed and repaired or replaced.

#### ENGINE ELECTRICAL SYSTEM MAINTNANCE

The engine's electrical system incorporates an electronic control module (ECM) to control various related components. The electrical system connections and ground circuits require good connections. Follow the recommended maintenance schedule in this section to maintain optimum performance. When inspecting the electrical system check the following:

- Check Positive and Negative cables for corrosion, rubbing, chafing, burning and to ensure tight connections at both ends.
- Check battery for cracks or damage to the case and replace if necessary.
- Inspect engine wire harness for rubbing, chafing, pinching, burning, and cracks or breaks in the wiring.
- Verify that engine harness connectors are correctly locked in by pushing in and then pulling the connector halves outward.
- Inspect ignition coil wire for hardening, cracking, arcing, chafing, burning, separation, split boot covers.
- Check spark plug wires for hardening, cracking, chafing, arcing or burning, separation, and split boot covers.
- Replace spark plugs at the required intervals per the recommended maintenance schedule.
- Verify that all electrical components are securely mounted to the engine or chassis.

- Verify that any additional electrical services installed by the owner are properly installed in the system.
- Verify that the MIL, charging, and oil pressure lights illuminate momentarily during engine start.

#### **ENGINE CRANKCASE OIL**

#### **OIL RECOMMENDATION**

It is recommended to use GM Specification GM6094M. To achieve proper engine performance and durability, it is important that you only use engine lubricating oils displaying the American Petroleum Institute (API) "Starburst" Certification Mark 'FOR GASOLINE ENGINES' on the container.

Gasoline engines that are converted to run on LPG or NG fuels must use oils labeled for gasoline engines. Oils specifically formulated for Heavy Duty or Natural Gas Engines are not acceptable

#### **IMPORTANT:**

Oils recommended by the engine manufacturer already contain a balanced additive treatment. Oils containing "solid" additives, non-detergent oils, or low quality oils are not recommended by the engine manufacturer. Supplemental additives added to the engine oil are not necessary and may be harmful. The engine and fuel system supplier do not review, approve or recommend such products.

#### SYNTHETIC OILS

Synthetic oils have been available for use in industrial engines for a relatively long period of time and may offer advantages in cold and hot temperatures. However, it is not known if synthetic oils provide operational or economic benefits over conventional petroleum-based oils in industrial engines. Use of synthetic oils does not permit the extension of oil change intervals.

#### CHECKING/FILLING ENGINE OIL LEVEL

#### **IMPORTANT:**

Care must be taken when checking engine oil level. Oil level must be maintained between the "ADD" mark and the "FULL" mark on the dipstick.

To ensure that you are not getting a false reading, make sure the following steps are taken before checking the oil level.

- 1. Stop engine.
- 2. Allow approximately several minutes for the oil to drain back into the oil pan.
- 3. Remove the dipstick. Wipe with a clean cloth or paper towel and reinstall. Push the dipstick all the way into the dipstick tube.
- 4. Remove the dipstick and note the amount of oil on the dipstick. The oil level must be between the "FULL" and "ADD" marks.

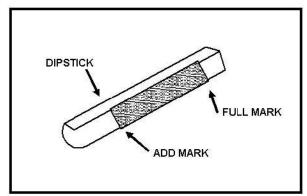

Figure 2 Engine Oil Dip tick (Typical)

- 5. If the oil level is below the "ADD" mark reinstall the dipstick into the dipstick tube and proceed to Step 6.
- 6. Remove the oil filler cap from the valve cover.
- 7. Add the required amount of oil to bring the level up to, but not over, the "FULL" mark on the dipstick Reinstall the oil filler cap to the valve rocker arm cover and wipe any excess oil clean.

#### CHANGING THE ENGINE OIL

#### **IMPORTANT:**

When changing the oil, always change the oil filter.

1. Start the engine and run until it reaches normal operating temperature.

# 

An overfilled crankcase (oil level being too high) can cause an oil leak, a fluctuation or drop in oil pressure. When overfilled, the engine crankshafts splash and agitate the oil, causing it to aerate or foam.

#### **IMPORTANT:**

Change oil when engine is warm and the old oil flows more freely.

2. Stop engine

#### **IMPORTANT:**

Engine oil will be hot. Use protective gloves to prevent burns. Engine oil contains chemicals which may be harmful to your health. Avoid skin contact.

- 3. Remove drain plug and allow the oil to drain.
- 4. Remove and discard oil filter and its sealing ring.
- 5. Coat sealing ring on the new filter with clean engine oil, wipe the sealing surface on the filter mounting surface to remove any dust, dirt or debris. Tighten filter securely (follow filter manufacturers instructions). Do not over tighten.
- 6. Check sealing ring on drain plug for any damage, replace if necessary, wipe plug with clean rag, wipe pan sealing surface with clean rag and re-install plug into the pan. Tighten to specification.
- 7. Fill crankcase with oil.
- 8. Start engine and check for oil leaks.
- 9. Dispose of oil and filter in a safe manner.

#### FUEL SYSTEM INSPECTION AND MAINTENANCE

### GASOLINE AND LPG FUEL SYSTEM

The fuel system installed on this industrial engine has been designed to meet the mobile engine emission standard applicable for the 2010 and later model years. To ensure compliance to these standards, follow the recommended maintenance schedule contained in this section.

# INSPECTION AND MAINTENANCE OF THE FUEL STORAGE CYLINDER

The fuel storage cylinder should be inspected daily or at the beginning of each operational shift for any leaks, external damage, adequate fuel supply and to ensure the manual service valve is open. Fuel storage cylinders should always be securely mounted, inspect the securing straps or retaining devices for damage ensure that all locking devices are closed and locked. Check to ensure that the fuel storage cylinder is positioned with the locating pin in the tank collar on all horizontally mounted cylinders this will ensure the proper function of the cylinder relief valve.

When refueling or exchanging the fuel cylinder, check the quick fill valve for thread damage. Also verify O-ring is in place and inspect for cracks, chunking or separation. If damage to the o-ring is found, replace prior to filling. Check the service line quick coupler for any thread damage.

#### **IMPORTANT:**

When refueling the fuel cylinder, wipe both the female and male connection with a clean rag prior to filling to prevent dust, dirt and debris from being introduced to the fuel cylinder.

# INSPECTION AND REPLACEMENT OF THE FUEL FILTER

The fuel system on this emission certified engine may utilize an in-line replaceable fuel filter element. This element should be replaced, at the intervals specified in the recommended maintenance schedule. When inspecting the fuel filter check the following:

• Check for leaks at the inlet and outlet fittings, using a soapy solution or an electronic leak detector and repair if necessary.

- Check to make sure filter is securely mounted.
- Check filter housing for external damage or distortion. If damaged replace fuel filter.

### **REPLACING THE FUEL FILTER:**

- 1. Move the equipment to a well ventilated area and verify that sparks, ignition and any heat sources are not present.
- 2. Start the engine.
- 3. If the engine operates on a positive pressure fuel system, run the engine with the fuel supply closed to remove fuel from the system.

#### **IMPORTANT:**

A small amount of fuel may still be present in the fuel line. Use gloves and proper eye protection to prevent burns. If liquid fuel continues to flow from the connections when removed, make sure the manual valve is fully closed.

- 4. Slowly loosen the inlet fitting and disconnect.
- 5. Slowly loosen the outlet fitting and disconnect.
- 6. Remove the filter housing form the equipment.
- 7. Check for contamination.
- 8. Tap the opening of the filter on a clean cloth.
- 9. Check for debris.
- 10. Check canister for proper mounting direction.
- 11. Reinstall the filter housing to the equipment.
- 12. Tighten the inlet and outlet fittings to specification.
- 13. Check for leaks at the inlet and outlet fittings, and the filter housing end connection using a soapy solution or an electronic leak detector, if leaks are detected make repairs

#### DIRECT ELECTRONIC PRESSURE REGULATOR (DEPR) MAINTENANCE AND INSPECTION

#### IMPORTANT:

The Direct Electronic Pressure Regulator (DEPR) components have been specifically designed and calibrated to meet the fuel system requirements of the emission certified engine.

If the DEPR fails to operate or develops a leak, it should be repaired or replaced with the OEM recommended replacement parts. When inspecting the system check for the following items:

- Check for any fuel leaks at the inlet and outlet fittings.
- Check for any fuel leaks in the IEPR body.
- Check the inlet and outlet fittings of the coolant supply lines for water leaks if applicable.
- Check to ensure the IEPR is securely mounted and the mounting bolts are tight.
- Check IEPR for external damage.
- Check IEPR electrical connection to ensure the connector is seated and locked.

# CHECKING/DRAINING OIL BUILD-UP IN THE VAPORIZER REGULATOR

During the course of normal operation for LPG engines oil or "heavy ends" may build inside the secondary chamber of the Vaporizer Regulator. These oil and heavy ends may be a result of poor fuel quality, contamination of the fuel, or regional variation of the fuel make up. A significant build up of oil can affect the performance of the secondary diaphragm response. The Recommended Maintenance Schedule found in this section recommends that the oil be drained periodically. This is the minimum requirement to maintain the emission warranty. More frequent draining of the Vaporizer Regulator is recommended where substandard fuel may be a problem. PSI recommends the Vaporizer Regulator be drained at every engine oil change if contaminated or substandard fuel is suspected or known to be have been used or in use with the emission complaint fuel system. This is known as special maintenance, and failure to follow this recommendation may be used to deny a warranty claim.

### **IMPORTANT:**

Draining the regulator when the engine is warm

will help the oils to flow freely from the regulator.

To drain the regulator, follow the steps below:

- 1. Move the equipment to a well ventilated area and ensure no external ignition sources are present.
- 2. Start the engine.
- 3. With the engine running close the manual valve.
- 4. When the engine runs out of fuel turn OFF the key when the engine stops and disconnect the negative battery cable.

### **IMPORTANT:**

A small amount of fuel may still be present in the fuel line, use gloves to prevent burns, wear proper eye protection. If liquid fuels continues to flow from the connections when loosened check to make sure the manual valve is fully closed.

- 5. Loosen the hose clamp at the inlet and outlet hoses and remove the hoses.
- 6. Remove the regulator mounting bolts.
- 7. Place a small receptacle in the engine compartment.
- 8. Rotate the regulator to 90° so that the outlet fitting is pointing down into the receptacle and drain the regulator.
- 9. Inspect the secondary chamber for any large dried particles and remove.
- 10. Remove the receptacle and reinstall the regulator retaining bolts and tighten to specifications.
- 11. Reinstall the fuel hoses..
- 12. Reconnect any other hoses removed during this procedure.

13. Slowly open the manual service valve. IMPORTANT:

The fuel cylinder manual valve contains an "Excess Flow Check Valve" open the manual valve slowly to prevent activating the "Excess Flow Check Valve."

- Check for leaks at the inlet and outlet fittings using a soapy solution or an electronic leak detector. If leaks are detected make repairs. Check coolant line connections to ensure no leaks are present.
- 15. Start engine recheck for leaks at the regulator.
- 16. Dispose of any drained material in safe and proper manner.

#### AIR FUEL MIXER/THROTTLE CONTROL DEVICE MAINTENANCE AND INSPECTION

### IMPORTANT:

The Air Fuel Mixer components have been specifically designed and calibrated to meet the fuel system requirements of the emission certified engine. The mixer should not be disassembled or rebuilt. If the mixer fails to operate or develops a leak the mixer should be replaced with the OEM recommended replacement parts.

When inspecting the mixer check for the following items:

- Leaks at the inlet fitting.
- Fuel inlet hose for cracking, splitting or chaffing, replace if any of these condition exist.
- Ensure the mixer is securely mounted and is not leaking vacuum at the mounting gasket or surface.
- Inspect air inlet hose connection and clamp. Also inspect inlet hose for cracking, splitting or chafing. Replace if any of these conditions exist.
- Inspect Air cleaner element according to the Recommended Maintenance Schedule found in this section.
- Check Fuel lines for cracking, splitting or chafing. Replace if any of these conditions exist.
- Check for leaks at the throttle body and intake manifold.

#### EXHAUST SYSTEM AND CATALYTIC CONVERTER INSPECTION AND MAINTENANCE

#### **IMPORTANT:**

The exhaust system on this emission certified engine contains a Heated Exhaust Gas Oxygen Sensor (HEGO) which provides feed back to the ECM on the amount of oxygen present in the exhaust stream after combustion.

The oxygen in the exhaust stream is measured in voltage and sent to the ECM. The ECM then makes corrections to the fuel air ratio to ensure the proper fuel charge and optimum catalytic performance. Therefore, it is important that the exhaust connections remain secured and air tight.

### **IMPORTANT:**

The HEGO sensor is sensitive to silicone based products. Do not use silicone sprays or hoses which are assembled using silicone lubricants. Silicone contamination can cause severe damage to the HEGO.

When inspecting the Exhaust system check the following:

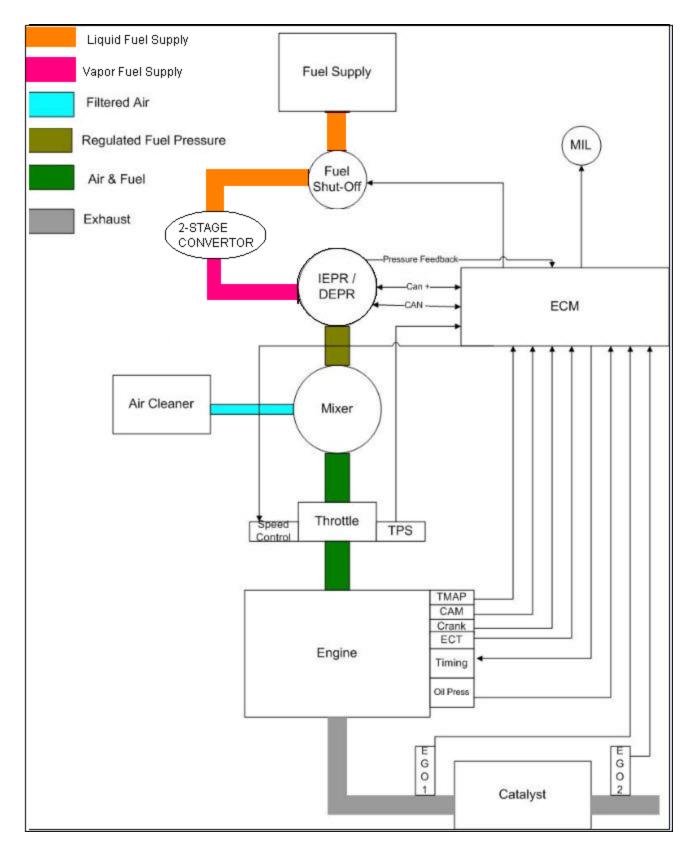

- Exhaust manifold at the cylinder head for leaks and that all retaining bolts and shields (if used) are in place.
- Manifold to exhaust pipe fasteners to ensure they are tight and that there are no exhaust leaks repair if necessary.
- HEGO electrical connector to ensure connector is seated and locked, check wires to ensure there is no cracking, splits chafing or "burn through." Repair if necessary.
- Exhaust pipe extension connector for leaks tighten if necessary
- If the engine is equipped with a catalytic converter inspect the converter to ensure it is securely mounted.
- Check for any leaks at the inlet and outlet of the converter.

# TIER 3 CERTIFIED MOBILE ENGINE MAINTENANCE REQUIREMENTS

Perform the following maintenance on th	e engine at	the hours i	ndicated and	d at equival	ent hour int	ervals there	after.		
				In	terval Ho	urs			
	Daily	200	400	800	1000	1250	1500	1750	2000
General Maintenance Section									
Visual check for fluid leaks	Х								
Check engine oil level	Х								
Check coolant level	Х								
Change engine oil and filter		•	Every 1	50 hours	s or 120 c	lays of o	peration		
Check LPG system for leaks			Prior to	o any serv	ice or ma	intenance	e activity		
Inspect accessory drive belts for cracks, breaks, splits or glazing					Х				
Inspect electrical system wiring for cuts, abrasions or corrosion									Х
Inspect all vacuum lines and fittings for cracks, breaks or hardening									Х
Engine Coolant Section									
Clean debris from radiator core			Every	100 hour	s or 60 d	ays of op	eration		
Change coolant				Х					
Inspect coolant hoses for cracks, swelling or deterioration					Х				
Engine Ignition System									
Replace spark plugs									Х
Inspect battery case for damage					Х				
Check spark plug wires for cuts abrasions or hardening									Х
Replace distributor cap and rotor				Х					
Replace spark plug wires				Х					
Fuel System Maintenance									
Inspect air cleaner		Every	200 hour	s, or eve	ry 100 ho	ours in du	ısty envir	onment	
Replace filter element	Every 400 hours, or every 200 hours in dusty enviroment								
Replace fuel filter			Х						
Inspect Shut-off Valve for leaks and closing									Х
Leak check fuel lines									Х
Check air induction for leaks									Х
Check manifold for vacuum leaks									Х
Drain LPG Vaporizer oil build up			Every 1	150 hours	s or 120 c	lays of o	peration		
Engine Exhaust System									
Inspect exhaust manifold for leaks									Х
Inspect exhaust piping for leaks									Х
Check HEGO sensor(s) connector and wires for burns, cuts or damage									Х
Inspect catalyst for mechanical damage									Х
The Maintenance schedule erpresents manufacturers recommend					-			-	
federal regulations may require equipment opeatos to conduct co	ompreshen	sive engin	e/equipmer	nt inspection	ons at more	e periodic i	ntervals th	an thost sp	ecified
above.									

# **LPG Fuel System**

# **MOBILE ENGINE LPG FUEL SYSTEM SCHEMATIC**

# DESCRIPTION AND OPERATION OF THE FUEL SYSTEMS

## NG & LPL FUEL SYSTEM

The primary components of the fuel system are the fuel supply, direct electronic pressure regulator (DEPR), fuel mixer, electronic throttle control (ETC) device, 2-Stage convertor, engine control module (ECM), and a catalytic converter. The system operates on a slightly positive fuel pressure. Primary fuel pressure can be measured at the LD 2-Stage convertor. Secondary fuel pressure command and actual fuel pressure is monitored by the ECM. You can view these pressures using the diagnostic service tool.

## SERVICE LINES

Fuel flows from the fuel supply to the electric lock off valve. The service lines are not supplied by the engine manufacturer. Please contact the equipment manufacturer regarding fuel service lines

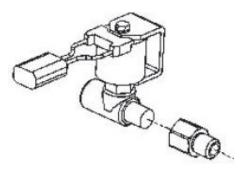

### FUEL FILTER

LP, fuel like all other motor fuels is subject to contamination from outside sources. Refueling of the equipment tank and removal of the tank from the equipment can inadvertently introduce dirt and other foreign matter into the fuel system. It is therefore necessary to filter the fuel prior to entering the fuel system components down stream of the tank. An inline fuel filter has been installed in the fuel system to remove the dirt and foreign matter from the fuel, which is replaceable as a unit only. Maintenance of the filter is critical to proper operation of the fuel system and should be replaced according to the maintenance schedule or more frequently under severe operating conditions.

## ELECTRIC FUEL LOCK-OFF VALVE

The Electric Fuel lock-off valve is an integrated assembly consisting of a 12 volt solenoid and a normally closed valve. When energized, the solenoid opens the valve and allows the fuel to flow through the device. The valve opens during cranking and engine run cycles.

ELECTRIC FUEL LOCK-OFF

Voltage to the Electric Lock-Off Valve is controlled by the engine control module (ECM).

# DIRECT ELECTRONIC PRESSURE REGULATOR (DEPR)

The ECI engine management system uses the DEPR to control fuel delivery for the precise fuel metering necessary for optimum combustion, fuel economy and transient response. The DEPR is available in either a 19 or a 28 mm size.

The DEPR is a single-stage microprocessor based electromechanical fuel pressure regulator that incorporates a high speed/fast acting actuator. It communicates with the Engine Control Module (ECM) over a Controller Area Network (CAN) link, receiving fuel pressure commands and broadcasting DEPR operating parameters back to the ECM. The DEPR can regulate fuel pressure from -18 to +13 inches of water column above the Mixer air inlet pressure, providing sufficient control authority to stall an engine either rich or lean. When the DEPR receives an output pressure command from the ECM, the valve is internally driven to attain targeted fuel pressure, the DEPR then closes the loop internally using a built in fuel pressure sensor to maintain target fuel pressure/fuel flow rate, until another external command from the ECM is received (intervals < 10 ms). The DEPR has an integral fuel temperature sensor that is used by the ECM to correct for variations in fuel density. This strategy provides an extremely accurate method for open loop fuel control. Then with the addition of the preand post-cat oxygen sensors, the pressure command transmitted form the ECM can be further adjusted using closed loop feedback

Direct Electronic Pressure Regulator

The IEPR is an emission control device and should only be serviced by qualified technicians.

### AIR FUEL MIXER

The air valve mixer is a self-contained air-fuel metering device. The mixer is an air valve design, utilizing a relatively constant pressure drop to draw fuel into the mixer from cranking speeds to full load. The mixer is mounted in the air stream ahead of the throttle control device.

When the engine begins to crank it draws in air with the air valve covering the inlet, and negative pressure begins to build. This negative pressure signal is communicated to the top of the air valve chamber through vacuum ports in the air valve assembly. A pressure/force imbalance begins to build across the air valve diaphragm between the air valve vacuum chamber and the atmospheric pressure below the diaphragm. The vacuum being created is referred to as Air Valve Vacuum (AVV). As the air valve vacuum reaches the imbalance point, the air valve begins to lift against the air valve spring. The amount of AVV generated is a direct result of the throttle position. At low engine speed the air valve vacuum and the air valve position is low thus creating a small venturi for the fuel to flow. As the engine speed increases the AVV increases and the air valve is lifted higher thus creating a much larger venturi. This air valve vacuum is communicated from the mixer venturi to the IEPR via the fuel supply hose.

The mixer is equipped with a low speed mixture adjustment retained in a tamper proof housing. The mixer has been preset at the factory and should not require adjustment. In the event that the idle adjustment should need to be adjusted refer to the Fuel System Repair section of this manual.

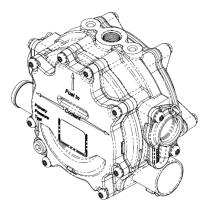

The air/fuel mixer is an emission control device. Components inside the mixer are specifically calibrated to meet the engine's emissions requirements and should never be disassembled or rebuilt. If the mixer fails to function correctly, replace with an OEM replacement part.

Air Valve Mixer

Light Duty 2-Stage Vaporizer

The tier 3 certified mobile products utilize a 2-stage vaporizer as part of the fuel system. The primary function of this part is to convert liquid LP fuel into a propane vapor. The vapor is then introduced into the DEPR where the pressures are regulated. Converting the fuel from a liquid to a vapor is accomplished by passing the propane through a heat exchanger inside the convertor. Coolant flows through the convertor as part of the heat exchange process.

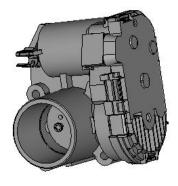

LD 2-Stage Vaporizer

# ELECTRONIC THROTTLE CONTROL DEVICE (ETC)—

Engine speed is controlled by the ECM and the Electronic Throttle Control device which is an automotive style throttle. The ECM controls engine speed one of several ways depending on the equipment manufacturer's requirement. Engine speed can be controlled by discrete speed governing, whereby the OEM sends an open, high or low voltage signal to an ECM pin. The ECM then targets the preprogrammed speed for that pin. The other two modes are through the use of a foot pedal or a hand throttle controller. In both cases the foot pedal or hand throttle controller will send a 0-5 volt signal to the ECM. The ECM is programmed with an idle and high speed and interprets speed in between the two based on voltage.

When the engine is running electrical signals are sent from the foot pedal position sensor to the engine ECM when the operator depresses or release the foot pedal. The ECM then sends an electrical signal to the motor on the electronic throttle control to increase or decrease the angle of the throttle blade thus increasing or decreasing the air/fuel charge to the engine. The electronic throttle control device incorporates two internal Throttle Position Sensors (TPS) which provide output signals to the ECM as to the location of the throttle shaft and blade. The TPS information is used by the ECM to correct for speed and load control as well as emission.

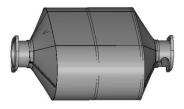

**Electronic Throttle Control Device** 

### THREE-WAY CATALYTIC CONVERTER

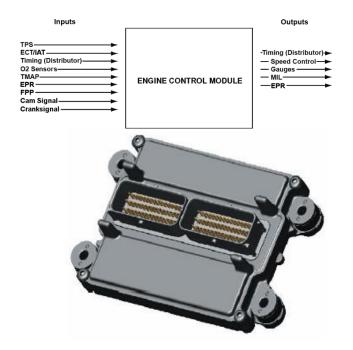

The Catalytic Converter is a component of the emissions system which is designed to meet the emission standards in effect for the Tier 3 mobile certified product.

The exhaust gases pass through the honeycomb catalyst which is coated with a mixture of precious group metals to oxidize and reduce CO, HC and NOX emission gases.

#### Three Way Catalytic Converter ENGINE CONTROL MODULE

To obtain maximum effect from the catalyst and accurate control of the air fuel ratio, the emission certified engine is equipped with an onboard computer or Engine Control Module (ECM). The ECM is a 32 bit controller which receives input data from sensors mounted to the engine and fuel system and then outputs various signals to control engine operation.

### Engine Control Module (ECM)

One specific function of the controller is to maintain a closed loop fuel control which is accomplished by use of the Heated Exhaust Gas Oxygen sensor (HEGO) mounted in the exhaust system. The HEGO sensor sends a voltage signal to the controller which then outputs signals to the EPR to change the amount of fuel being delivered from the regulator or mixer to the engine.

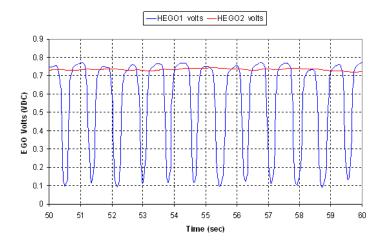

The controller also performs diagnostic functions on the fuel system and notifies the operator of engine malfunctions by turning on a Malfunction Indicator Light (MIL) mounted in the dash. Malfunctions in the system are identified by a Diagnostic Trouble Code (DTC) number. In addition to notifying the operator of the malfunction in the system, the controller also stores the information about the malfunction in its memory. A technician can than utilize a computerized diagnostic scan tool to retrieve the stored diagnostic code and by using the diagnostic charts in this manual to determine the cause of the malfunction. In the event a technician does not have the computerized diagnostic tool, the MIL light can be used to identify the diagnostic code to activate the "blink" feature and count the number of blinks to determine the diagnostic code number to locate the fault in the system.

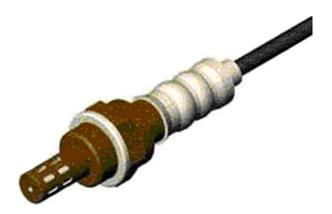

#### HEATED EXHAUST GAS OXYGEN SENSORS

The Heated Exhaust Gas Oxygen (HEGO) Sensors are mounted in the exhaust system, one upstream and one downstream of the catalytic converter. Models that do not use a catalyst assembly will only use one HEGO sensor.

The HEGO sensors are used to measure the amount of oxygen present in the exhaust stream to determine whether the air-fuel ratio is to rich or to lean. It then communicates this measurement to the ECM. If the HEGO sensor signal indicates that the exhaust stream is too rich, the ECM will decrease or lean the fuel mixture during engine operation. If the mixture is too lean, the ECM will richen the mixture. If the ECM determines that a rich or lean condition is present for an extended period of time which cannot be corrected, the ECM will set a diagnostic code and turn on the MIL light in the dash.

By monitoring output from the sensor upstream and the sensor downstream of the catalytic converter, the ECM can determine the performance of the catalyst.

The Heat Exhaust Gas Oxygen (HEGO) Sensor

HEGO1 (upstream or before the catalytic converter) and HEGO2 (downstream) voltage output.

The Heated Exhaust Gas Oxygen Sensor (HEGO) is an emissions control component. In the event of a failure, the HEGO should only be replaced with the recommended OEM replacement part. The HEGO is sensitive to silicone based products and can become contaminated. Avoid using silicone sealers or air or fuel hoses treated with a silicone based lubricant.

### TMAP SENSOR

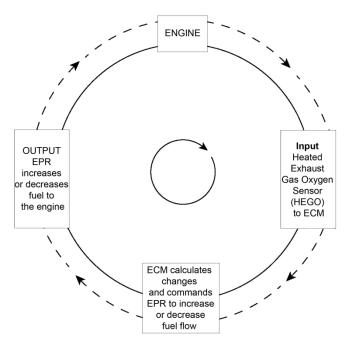

The Temperature Manifold Absolute Pressure or TMAP sensor is a variable resistor used to monitor the difference in pressure between the intake manifold and outside or atmospheric pressure and the temperature. The ECM monitors the resistance of the sensor to determine engine load (the vacuum drops when the engine is under load or at wide open throttle). When the engine is under load, the computer may alter the fuel mixture to improve performance and emissions. The temperature is also monitored by the ECM, primarily to richen the fuel/air mixture during a cold start.

#### COOLANT TEMPERATURE SENSOR

The Engine Coolant Temperature sensor or ECT is a variable resistance thermistor that changes resistance as the engine's coolant temperature changes. The sensor's output is monitored by the ECM to determine a cold start condition and to regulate various fuel and emission control functions via a closed loop emission system.

### OIL PRESSURE SENDER

The Engine Oil Pressure sensor is designed to ensure adequate lubrication throughout the engine. It provides a pressure value for the oil pressure gauge and is monitored by the ECM. If the pressure drops, an MIL will occur.

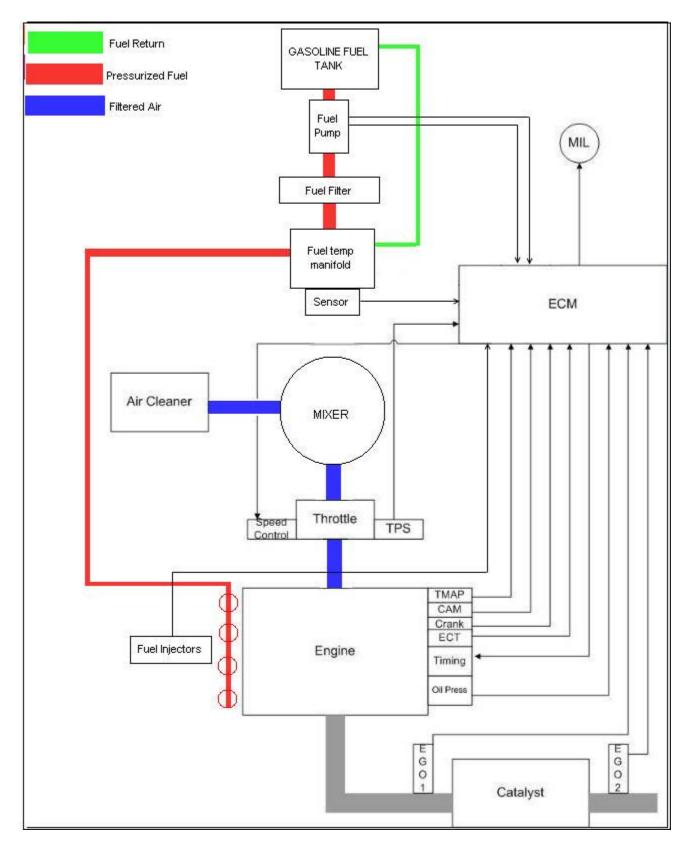

#### Closed-Loop Fuel Control

LD 2-Stage Regulator Nominal Pressure Specifications

Secondary Stage	15.25 $\pm 10$ inches H20
Primary Stage	2.6 ±1.45PSI

# **Gasoline Fuel System**

# MOBILE ENGINE GASOLINE FUEL SYSTEM SCHEMATIC

# GASOLINE MULTI POINT FUEL INJECTON (3.0L Engine)

The primary components of the Gasoline Multi Point Fuel Injection (MPFI) fuel system are the gasoline fuel tank, electric fuel pump, fuel pressure and temperature sensor manifold, fuel filter and fuel rail.

# GASOLINE FUEL STORAGE TANK

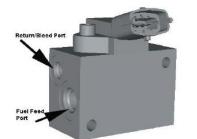

The gasoline fuel storage tank location may very on equipment applications. The fuel tank may be integrated into the chassis frame or may be a stand alone vessel mounted on the equipment. For precise location for the equipment application refer to the OEMs vehicle manual.

# **GASOLINE FUEL PUMP**

The Gasoline is stored as a liquid in the fuel tank and in drawn into the fuel system by a 12 volt electric fuel pump. Depending on the vehicle application the fuel pump may be mounted in the fuel tank or as a stand alone component. In either case the fuel pump will receive a signal from the ECM at Key On to prime the fuel system for approximately 2 seconds prior to start. Priming of the fuel system provides for a quicker start, when the engine begins to crank. Consult the OEM for the location of the fuel pump.

# GASOLINE PRESSURE AND TEMPERATURE SENSOR MANIFOLD

This engine is equipped with a fuel injector rail that does not have a pressure regulator or a return circuit to the fuel tank. Fuel pressure for this engine is regulated by the engine's ECM. The ECM receives fuel pressure and temperature feedback from the gasoline fuel sensor manifold and uses this information to control the ground side of the fuel pump. Fuel pressure is regulated by the ECM pulse width modulating (PWM) the fuel pump. The fuel pressure and temperature sensor manifold has a return or "bleed" circuit that connects back to the equipment fuel tank. This circuit is used to bleed off any vapor that develops in the line and returns a small amount of fuel to the tank. The fuel comes from the fuel pressure and temperature manifold assembly. Fuel exits the fuel pump, passes through the filter and then enters the fuel pressure and temperature manifold assembly. Fuel flows through the feed circuit and is delivered to the fuel injector rail. Fuel that enters the bleed circuits through the by-pass valve in the manifold is returned to the fuel tank.

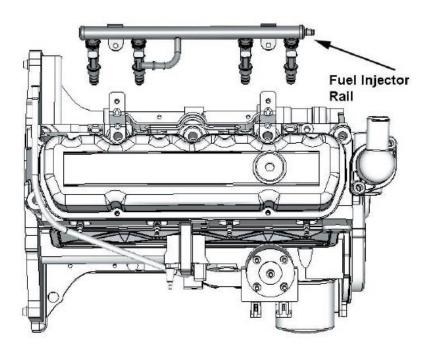

Gasoline Fuel Pressure and Temperature Manifold Assembly

# **FUEL FILTER**

After the fuel is drawn into the fuel pump, the fuel flows through the gasoline fuel filter. The fuel filter will trap small particles. The fuel passes through the filter to remove debris which prevents the fuel pressure and temperature manifold and fuel injectors from becoming damaged. Maintenance of the fuel filter is required as indicated in the *Recommended Maintenance Schedule*. A more frequent replacement of the filter may be required if the equipment operates in a dusty or dirty environment.

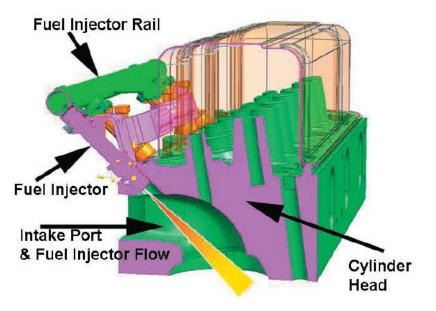

# FUEL INJECTOR RAIL

The fuel flows from the fuel pressure and temperature manifold assembly to the fuel rails where the fuel is delivered to the fuel injectors. The fuel rail also contains a Schrader valve which is utilized to test the regulated pressure of the fuel system.

### **FUEL INJECTOR**

The fuel supply is maintained on the top of the injector from the injector rail. The injector is fed a "pulse" signal through the wire harness which causes the injector to open. During regular operating conditions the ECM controls the opening and duration of opening of the injector. During lower RPM operation the injector signals or "pulses" are less frequent then when the engine is operating at higher RPMs. The certified engine has been calibrated to deliver the precise amount of fuel for optimum performance and emission control.

# GASOLINE IAFM Manifold (4.3L Engine)

The primary components of the Gasoline IAFM fuel system are the gasoline fuel tank, electric fuel pump, fuel pressure and temperature sensor manifold, Intake manifold, and IAFM.

# **GASOLINE FUEL STORAGE TANK**

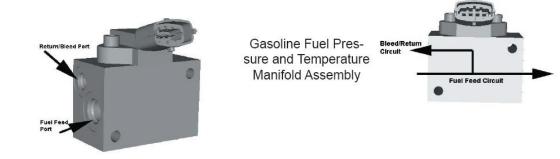

The gasoline fuel storage tank location may very on equipment applications. The fuel tank may be integrated into the chassis frame or may be a stand alone vessel mounted on the equipment. For precise location for the equipment application refer to the OEMs vehicle manual.

# **GASOLINE FUEL PUMP**

The Gasoline is stored as a liquid in the fuel tank and in drawn into the fuel system by a 12 volt electric fuel pump. Depending on the vehicle application the fuel pump may be mounted in the fuel tank or as a stand alone component. In either case the fuel pump will receive a signal from the ECM at Key On to prime the fuel system for approximately 2 seconds prior to start. Priming of the fuel system provides for a quicker start, when the engine begins to crank. Consult the OEM for the location of the fuel pump.

# GASOLINE PRESSURE AND TEMPERATURE SENSOR MANIFOLD

This engine is equipped with a fuel injector rail that does not have a pressure regulator or a return circuit to the fuel tank. Fuel pressure for this engine is regulated by the engine's ECM. The ECM receives fuel pressure and temperature feedback from the gasoline fuel sensor manifold and uses this information to control the ground side of the fuel pump. Fuel pressure is regulated by the ECM pulse width modulating (PWM) the fuel pump. The fuel pressure and temperature sensor manifold has a return or "bleed" circuit that connects back to the equipment fuel tank. This circuit is used to bleed off any vapor that develops in the line and returns a small amount of fuel to the tank. The fuel comes from the fuel pressure and temperature manifold assembly. Fuel exits the fuel pump, passes through the filter and then enters the fuel pressure and temperature manifold assembly. Fuel flows through the feed circuit and is delivered to the fuel injector rail. Fuel that enters the bleed circuits through the by-pass valve in the manifold is returned to the fuel tank.

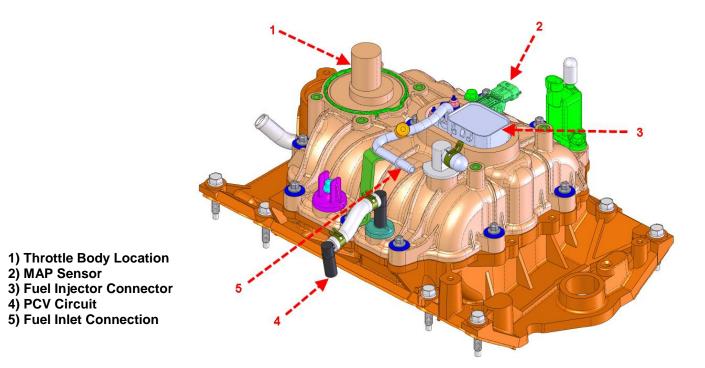

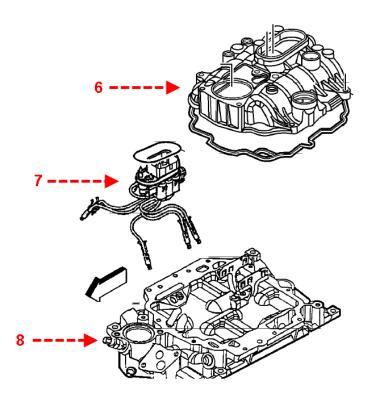

# **FUEL FILTER**

After the fuel is drawn into the fuel pump, the fuel flows through the gasoline fuel filter. The fuel filter will trap small particles. The fuel passes through the filter to remove debris which prevents the fuel pressure and temperature manifold and fuel injectors from becoming damaged. Maintenance of the fuel filter is required as indicated in the *Recommended Maintenance Schedule*. A more frequent replacement of the filter may be required if the equipment operates in a dusty or dirty environment.

## **IAFM Intake Manifold**

IAFM is the acronym for Intake Air Fuel Module. This style intake manifold incorporates the air intake manifold and gasoline fuel delivery system into one module. The IAFM is used on the 4.3L GM engine.

## **Fuel Injectors**

The IAFM system uses one fuel injector per cylinder. The injectors are routed to each intake port internally as shown in number 7. The nominal fuel pressure is typically in the range of 74 psia.

- 6) Upper Intake 7) Fuel Injectors
- 8) Lower Intake

# **Fuel System Diagnosis**

# **FUEL SYSTEM DIAGNOSIS**

Direct Electronic Pressure Regulator Assembly

### FUEL SYSTEM DESCRIPTION

The Engine Control Module (ECM) receives information from various engine sensors in order to control the operation of the Direct Electronic Pressure Regulator (DEPR) and lock-off Valve. The lock-off Valve solenoid prevents fuel flow unless the engine is cranking or running.

At Key ON, the DEPR valve receives a two (2) second prime pulse from the ECM, allowing time for the fuel to flow through the fuel filter and fuel lines to the DEPR.

Fuel travels from the lock-off to the light duty 2stage regulator into the DEPR.

Engine cranking generates vacuum which provided lift for the mixer air valve and is commonly referred to as air valve vacuum. Once in the mixer, the fuel is combined with air and is drawn into the engine for combustion.

### DIAGNOSTIC AIDS

This procedure is intended to diagnose equipment operating on LPG. If the equipment will not continue to run, refer to Hard Start for preliminary checks.

- Inspect the fuel supply lines to verify they are properly connected and do not have any kinks or damage
- Verify the fuel lock off valve is operating properly. Refer to the OEM for information on the fuel shut off valve.

#### **TOOLS REQUIRED:**

### DST

• Diagnostic Scan Tool (DST)

#### PRESSURE GAUGES

• ITK-2 Test Kit

### **TEST DESCRIPTION**

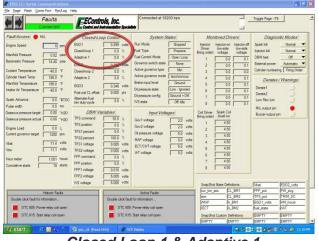

The basis of the fuel system test is to determine if the fuel is operating within proper fuel control parameters. This fuel control system operates on the basis of short term and long term fuel correction to compensate for the normal operation and aging of the engine. Abnormal operation of the engine, due to a component issue or lack of maintenance will cause fuel system control parameters to operate outside of the normal range.

The fuel system correction factors are viewable using the laptop based Diagnostic Service Tool (DST).

The short term correction factor is a percentage based fuel correction that will immediately be applied once the engine reaches the closed loop fuel control mode. The short term correction factor is known as "Closed Loop 1" on the DST.

The long term correction factor writes the short term correction into long term memory so it is available immediately on the next start/run cycle. The long term correction factor is known as "Adaptive 1" on the DST.

Closed Loop 1 and Adaptive 1 can be viewed on the Closed Loop Control panel on the Faults Page of the DST.

Closed Loop 1 & Adaptive 1

Any parameter found to be out of conformance will require additional diagnosis.

#### HOW THE CORRECTION FACTORS WORK

The correction factors are displayed in the DST as a positive or negative percent. The numbers will range between -35% and +35%. A negative fuel correction number indicates the removal of fuel.

An outside condition causing the system to be rich, such as a restricted air cleaner, can cause a negative short term and long term fuel correction. An outside condition causing the system to be lean, such as a vacuum leak, can cause a positive fuel correction.

## DETERMINING TOTAL FUEL CORRECTION

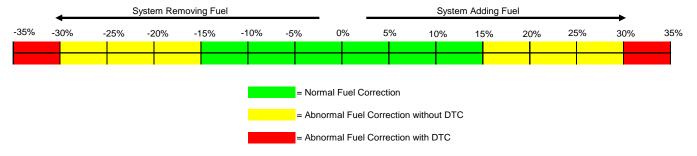

The total fuel correction is the sum of the short term correction (Closed Loop 1) and the long term correction (Adaptive 1).

For instance, a Closed Loop 1 reading of -1.5% and an Adaptive 1 reading of -3.5% would mean a total fuel correction of -5% was taking place at that time. The system is removing 5% fuel at that time.

A Closed Loop 1 reading of 1.5% and an Adaptive 1 reading of 3.5% (note both are positive numbers) would mean that a total fuel correction of 5% was taking place at that time. The system is adding 5% fuel.

#### NORMAL & ABNORMAL FUEL CORRECTION

Generally, the system is operating within specification when total fuel correction falls between -15% and +15%. Operation outside of this range will require further diagnosis to determine the system level issue affecting fuel control. The system will set Diagnostic Trouble Codes (DTC's) for correction factors in the +/- 30%-35% range. If total fuel correction is found to be operating outside of the normal range additional diagnostic procedure will be required to determine the cause. Follow the appropriate Symptom Routine or DTC Chart for additional help.

#### **Total Fuel Correction Chart**

# FUEL SYSTEM SYMPTOM DIAGNOSTICS

Checks	Action
	Before using this section, you should have performed On Board Diagnostic (OBD) Check and determined that:
Before Using This Section	<ol> <li>The ECM and MIL are operating correctly.</li> <li>There are no Diagnostic Trouble Codes (DTCs) stored, or a DTC exists but without a MIL.</li> </ol>
	Several of the following symptom procedures call for a careful visual and physical check. These checks are very important as they can lead to prompt diagnosis and correction of a problem.
Fuel System Check	<ol> <li>Verify the customer complaint.</li> <li>Locate the correct symptom table.</li> <li>Check the items indicated under that symptom.</li> <li>Operate the equipment under the conditions the symptom occurs. Verify HEGO switching between lean and rich. IMPORTANT! Normal HEGO switching indicates the fuel system is in closed loop and operating correctly at that time.</li> <li>Take a data snapshot using the DST under the condition that the symptom occurs to review at a later time.</li> </ol>
Visual and Physical Checks	<ul> <li>Check all ECM system fuses and circuit breakers.</li> <li>Check the ECM ground for being clean, tight and in its proper location.</li> <li>Check the vacuum hoses for splits, kinks and proper connections.</li> <li>Check thoroughly for any type of leak or restriction.</li> <li>Check for air leaks at all the mounting areas of the intake manifold sealing surfaces.</li> <li>Check for proper installation of the mixer assembly.</li> <li>Check for air leaks at the mixer assembly.</li> <li>Check the ignition wires for the following conditions:</li> <li>Cracking</li> <li>Hardening</li> <li>Proper routing</li> <li>Carbon tracking.</li> <li>Check the wiring for the following items: proper connections, pinches or cuts.</li> <li>The following symptom tables contain groups of possible causes for each symptom. The order of these procedures is not important. If the DST readings do not indicate a problem, then proceed in a logical order, easiest to check or most likely to cause the problem.</li> </ul>

# INTERMITTENT

Checks DEFINITION: The proble	Action m may or may not turn ON the (MIL) or store a Diagnostic Trouble Code (DTC).
Preliminary Checks	Do not use the DTC tables. If a fault is an intermittent, the use of the DTC ta- bles with this condition may result in the replacement of good parts.
	Faulty electrical connections or wiring can cause most intermittent problems. Check the suspected circuit for the following conditions:
Faulty Electrical Con- nections or Wiring	<ul> <li>Faulty fuse or circuit breaker, connectors poorly mated, terminals not fully seated in the connector (backed out). Terminals not properly formed or damaged.</li> <li>Wire terminals poorly connected.</li> <li>Terminal tension is insufficient.</li> </ul>
	<ul> <li>Carefully remove all the connector terminals in the problem circuit in order to ensure the proper contact tension.</li> <li>If necessary, replace all the connector terminals in the problem circuit in order to ensure the proper contact tension (except those noted as "Not Serviceable"). See section <i>Wiring Schematics</i>.</li> <li>Checking for poor terminal to wire connections requires removing the terminal from the connector body.</li> </ul>
Operational Test	If a visual and physical check does not locate the cause of the problem, op- erate the vehicle with the DST connected. When the problem occurs, an abnormal voltage or scan reading indicates a problem circuit.
Intermittent MIL Illumination	<ul> <li>The following components can cause intermittent MIL and no DTC(s):</li> <li>A defective relay.</li> <li>Switch that can cause electrical system interference. Normally, the problem will occur when the faulty component is operating.</li> <li>The improper installation of add on electrical devices, such as lights, 2-way radios, electric motors, etc.</li> <li>The ignition secondary voltage shorted to a ground.</li> <li>The MIL circuit or the Diagnostic Test Terminal intermittently shorted to ground.</li> <li>The MIL wire grounds.</li> </ul>
Loss of DTC Memory	<ol> <li>To check for the loss of the DTC Memory:</li> <li>Disconnect the TMAP sensor.</li> <li>Idle the engine until the MIL illuminates.</li> <li>The ECM should store a TMAP DTC which should remain in the memory when the ignition is turned OFF. If the TMAP DTC does not store and remain, the ECM is faulty.</li> </ol>

# **NO START**

Checks	Action
<b>DEFINITION:</b> The engine	cranks OK but does not start.
Preliminary Checks	None
ECM Checks	<ul> <li>Use the DST to :</li> <li>Check for proper communication with both the ECM</li> <li>Check all system fuses engine fuse holder. Refer to <i>Engine Controls Schematics.</i></li> <li>Check battery power, ignition power and ground circuits to the ECM. Refer to <i>Engine Control Schematics.</i> Verify voltage and/or continuity for each.</li> </ul>
Sensor Checks	<ul><li>Check the TMAP sensor.</li><li>Check the cam angle sensor for output (RPM).</li></ul>
Fuel System Checks	<ul> <li>Important: A closed LPG manual fuel shut off valve will create a no start condition.</li> <li>Check for air intake system leakage between the mixer and the throttle body. Verify proper operation of the low pressure lock-off solenoids.</li> <li>Verify proper operation of the fuel control solenoids.</li> <li>Check the fuel system pressures.</li> <li>Refer to the <i>LPG Fuel System Diagnosis</i>.</li> <li>Check for proper mixer air valve operation.</li> </ul>
Ignition System Checks	<ul> <li>Note: LPG being a gaseous fuel requires higher secondary ignition system voltages for the equivalent gasoline operating conditions.</li> <li>1. Check for the proper ignition voltage output with <i>J 26792</i> or the equivalent.</li> <li>2. Verify that the spark plugs are correct for use with LPG.</li> <li>Check the spark plugs for the following conditions: <ul> <li>Wet plugs.</li> <li>Cracks.</li> <li>Wear.</li> <li>Improper gap.</li> <li>Burned electrodes.</li> <li>Heavy deposits.</li> <li>Check for bare or shorted ignition wires.</li> <li>Check for loose ignition coil connections at the coil.</li> </ul> </li> </ul>

# **NO START**

Checks	Action
Engine Mechanical Checks	<ul> <li>Important: The LPG Fuel system is more sensitive to intake manifold leakage than the gasoline fuel system.</li> <li>Check for the following: <ul> <li>Vacuum leaks.</li> <li>Improper valve timing.</li> <li>Low compression.</li> <li>Improper valve clearance.</li> <li>Worn rocker arms.</li> <li>Broken or weak valve springs.</li> </ul> </li> <li>Worn camshaft lobes.</li> </ul>
Exhaust System Checks	<ul> <li>Check the exhaust system for a possible restriction:</li> <li>Inspect the exhaust system for damaged or collapsed pipes:</li> <li>Inspect the muffler for signs of heat distress or for possible internal failure.</li> <li>Check for possible plugged catalytic converter. Refer to <i>Restricted Exhaust System Diagnosis</i>.</li> </ul>

# HARD START

Checks	Action
<b>DEFINITION:</b> The engine or may start but immediat	e cranks OK, but does not start for a long time. The engine does eventually run, tely dies.
Preliminary Checks	Make sure the vehicle's operator is using the correct starting procedure.
Sensor Checks	<ul> <li>Check the Engine Coolant Temperature sensor with the DST. Compare the engine coolant temperature with the ambient air temperature on a cold engine. If the coolant temperature reading is more than 10 degrees greater or less than the ambient air temperature on a cold engine, check for high resistance in the coolant sensor circuit. Check the cam angle sensor.</li> <li>Check the Throttle Position (TPS) and Foot Pedal Position (FPP) sensor connections.</li> </ul>
Fuel System Checks	<b>Important</b> : A closed LPG manual fuel shut off valve will create an extended crank OR no start condition.
	• Verify the excess flow valve is not tripped or that the manual shut-off valve is not closed.
	<ul> <li>Check mixer assembly for proper installation and leakage.</li> <li>Verify proper operation of the low pressure lock-off solenoid.</li> <li>Verify proper operation of the EPR.</li> <li>Check for air intake system leakage between the mixer and the throttle body. Check the fuel system pressures. Refer to the <i>Fuel System Diagnosis</i>.</li> </ul>
	Note: LPG being a gaseous fuel requires higher secondary ignition system voltages for the equivalent gasoline operating conditions.
	<ul> <li>Check for the proper ignition voltage output with <i>J</i> 26792 or the equivalent.</li> <li>Verify that the spark plugs are the correct type and properly gapped.</li> </ul>
Ignition System Checks	<ul> <li>Check the spark plugs for the following conditions:</li> <li>Wet plugs.</li> <li>Cracks.</li> <li>Wear.</li> <li>Burned electrodes.</li> <li>Heavy deposits</li> <li>Check for bare or shorted ignition wires.</li> <li>Check for moisture in the distributor cap.</li> <li>Check for loose ignition coil connections.</li> </ul>
	Important:
	1. If the engine starts but then immediately stalls, check the cam angle sensor.
	2. Check for improper gap, debris or faulty connections.

# HARD START

Checks	Action
Engine Mechanical Checks	<ul> <li>Important: The LPG Fuel system is more sensitive to intake manifold leakage than the gasoline fuel supply system.</li> <li>Check for the following: <ul> <li>Vacuum leaks</li> <li>Improper valve timing</li> <li>Low compression</li> <li>Improper valve clearance.</li> <li>Worn rocker arms</li> <li>Broken or weak valve springs</li> <li>Worn camshaft lobes.</li> </ul> </li> <li>Check the intake and exhaust manifolds for casting flash.</li> </ul>
Exhaust System Checks	<ul> <li>Check the exhaust system for a possible restriction:</li> <li>Inspect the exhaust system for damaged or collapsed pipes.</li> <li>Inspect the muffler for signs of heat distress or for possible internal failure.</li> <li>Check for possible plugged catalytic converter. Refer to <i>Restricted Exhaust System Diagnosis</i>.</li> </ul>

### CUTS OUT, MISSES

increases, but normally fe	Action r jerking that follows engine speed, usually more pronounced as the engine load at below 1500 RPM. The exhaust has a steady spitting sound at idle, low speed, the fuel starvation that can cause the engine to cut-out.
Preliminary Checks	None
Ignition System Checks	<ol> <li>Start the engine.</li> <li>Check for proper ignition output voltage with spark tester J 26792.</li> <li>Check for a cylinder misfire.</li> <li>Verify that the spark plugs are the correct type and properly gapped.</li> <li>Remove the spark plugs and check for the following conditions:         <ul> <li>Insulation cracks.</li> <li>Wear.</li> <li>Improper gap.</li> <li>Burned electrodes.</li> <li>Heavy deposits.</li> </ul> </li> <li>Visually/Physically inspect the secondary ignition for the following:         <ul> <li>Ignition wires for arcing and proper routing.</li> <li>Cross-firing.</li> <li>Ignition coils for cracks or carbon tracking</li> </ul> </li> </ol>
Engine Mechanical Checks	<ul> <li>Perform a cylinder compression check. Check the engine for the following:</li> <li>Improper valve timing.</li> <li>Improper valve clearance.</li> <li>Worn rocker arms.</li> <li>Worn camshaft lobes.</li> <li>Broken or weak valve springs.</li> <li>Check the intake and exhaust manifold passages for casting flash.</li> </ul>
Fuel System Checks	<ul> <li>Check the fuel system:</li> <li>Plugged fuel filter.</li> <li>Low fuel pressure, etc. Refer to LPG Fuel System Diagnosis.</li> <li>Check the condition of the wiring to the low pressure lock-off solenoid.</li> </ul>
Additional Check	Check for Electromagnetic Interference (EMI), which may cause a misfire con- dition. Using the DST, monitor the engine RPM and note sudden increases in rpms displayed on the scan tool but with little change in the actual engine rpm. If this condition exists, EMI may be present. Check the routing of the second- ary wires and the ground circuit.

#### **HESITATION, SAG, STUMBLE**

Checks	Action
•	has a momentary lack of response when putting it under load. The condition peed. The condition may cause the engine to stall if it's severe enough.
Preliminary Checks	None.
Fuel System Checks	<ul> <li>Check the fuel pressure. Refer to <i>LPG Fuel System Diagnosis</i>.</li> <li>Check for low fuel pressure during a moderate or full throttle acceleration. If the fuel pressure drops below specification, there is possibly a faulty low pressure regulator or a restriction in the fuel system.</li> <li>Check the TMAP sensor response and accuracy.</li> <li>Check Shut-Off electrical connection.</li> <li>Check the mixer air valve for sticking or binding.</li> <li>Check the mixer assembly for proper installation and leakage. Check the EPR.</li> </ul>
Ignition System Checks	<ul> <li>Note: LPG being a gaseous fuel requires higher secondary ignition system voltages for the equivalent gasoline operating conditions. If a problem is reported on LPG and not gasoline, do not discount the possibility of a LPG only ignition system failure and test the system accordingly.</li> <li>Check for the proper ignition voltage output with <i>J 26792</i> or the equivalent. Verify that the spark plugs are the correct type and properly gapped.</li> <li>Check for faulty spark plug wires.</li> <li>Check for fouled spark plugs.</li> </ul>
Additional Check	<ul><li>Check for manifold vacuum or air induction system leaks.</li><li>Check the alternator output voltage.</li></ul>

#### BACKFIRE

Checks	Action
0	nites in the intake manifold, or in the exhaust system, making a loud popping
noise. Preliminary Check	None.
	Important! LPG, being a gaseous fuel, requires higher secondary igni- tion system voltages for the equivalent gasoline operating conditions. The ignition system must be maintained in peak condition to prevent backfire.
Ignition System Checks	<ul> <li>Check for the proper ignition coil output voltage using the spark tester <i>J26792</i> or the equivalent.</li> <li>Check the spark plug wires by connecting an ohmmeter to the ends of each wire in question. If the meter reads over 30,000 ohms, replace the wires.</li> <li>Check the connection at ignition coil.</li> <li>Check for deteriorated spark plug wire insulation.</li> <li>Remove the plugs and inspect them for the following conditions:</li> <li>Wet plugs.</li> <li>Cracks.</li> <li>Wear.</li> <li>Improper gap.</li> <li>Burned electrodes.</li> <li>Heavy deposits.</li> </ul>
Engine Mechanical Check	<ul> <li>Important! The LPG Fuel system is more sensitive to intake manifold leakage than a gasoline fuel supply system.</li> <li>Check the engine for the following: <ul> <li>Improper valve timing.</li> <li>Engine compression.</li> <li>Manifold vacuum leaks.</li> <li>Intake manifold gaskets.</li> <li>Sticking or leaking valves.</li> <li>Exhaust system leakage.</li> <li>Check the intake and exhaust system for casting flash or other restrictions.</li> </ul> </li> </ul>
Fuel System Checks	Perform a fuel system diagnosis. Refer to LPG Fuel System Diagnosis.

### LACK OF POWER, SLUGGISHNESS, OR SPONGINESS

Checks	Action
<b>DEFINITION:</b> The engine	e delivers less than expected power.
Preliminary Checks	<ul> <li>Refer to the LPG Fuel system OBD System Check.</li> <li>Compare the customer's vehicle with a similar unit to verify customer has an actual problem. Do not compare the power output of the vehicle oper- ating on LPG to a vehicle operating on gasoline as the fuels do have different drive feel characteristics.</li> <li>Remove the air filter and check for dirt or restriction.</li> <li>Check the vehicle transmission.</li> <li>Refer to the OEM transmission diagnostics.</li> </ul>
Fuel System Checks	<ul> <li>Check for a restricted fuel filter, contaminated fuel, or improper fuel pressure. Refer to <i>LPG Fuel System Diagnosis</i>.</li> <li>Check for the proper ignition output voltage with the spark tester <i>J 26792</i> or the equivalent.</li> <li>Check for proper installation of the mixer assembly. Check all air inlet ducts for condition and proper installation.</li> <li>Check for fuel leaks between the EPR and the mixer.</li> <li>Verify that the LPG tank manual shut-off valve is fully open.</li> <li>Verify that liquid fuel (not vapor) is being delivered to the EPR.</li> </ul>
Sensor Checks	<ul> <li>Check the Heated Exhaust Gas Oxygen Sensors (HEGO) for contamination and performance. Check for proper operation of the TMAP sensor.</li> <li>Check for proper operation of the TPS and FPP sensors.</li> </ul>
Exhaust System Checks	<ul> <li>Check the exhaust system for a possible restriction:</li> <li>Inspect the exhaust system for damaged or collapsed pipes.</li> <li>Inspect the muffler for signs of heat distress or for possible internal failure.</li> <li>Check for possible plugged catalytic converter.</li> </ul>
Engine Mechanical Check	<ul> <li>Check the engine for the following:</li> <li>Engine compression.</li> <li>Valve timing.</li> <li>Improper or worn camshaft.</li> <li>Refer to <i>Engine Mechanical</i> in the Service Manual.</li> </ul>
Additional Check	<ul> <li>Check the ECM grounds for being clean, tight, and in their proper locations.</li> <li>Check the alternator output voltage.</li> <li>If all procedures have been completed and no malfunction has been found, review and inspect the following items:</li> <li>Visually and physically, inspect all electrical connections within the suspected circuit and/or systems.</li> <li>Check the DST data.</li> </ul>

### ROUGH, UNSTABLE, OR INCORRECT IDLE, STALLING

Checks	Action
<b>DEFINITION:</b> The engine	runs unevenly at idle. If severe enough, the engine may shake.
Preliminary Check	None.
Sensor Checks	<ul> <li>Check the Heated Exhaust Gas Oxygen Sensors (HEGO) performance:</li> <li>Check for silicone contamination from fuel or improperly used sealant. If contaminated, the sensor may have a white powdery coating result in a high but false signal voltage (rich exhaust indication). The ECM will reduce the amount of fuel delivered to the engine causing a severe drivability problem.</li> </ul>
	Check the Temperature Manifold Absolute Pressure (TMAP) sensor re- sponse and accuracy.
Fuel System Checks	<ul> <li>Check for rich or lean symptom that causes the condition.</li> <li>Drive the vehicle at the speed of the complaint.</li> <li>Monitoring the oxygen sensors will help identify the problem.</li> <li>Check for a sticking mixer air valve.</li> <li>Verify proper operation of the EPR.</li> <li>Perform a cylinder compression test. Refer to <i>Engine Mechanical</i> in the Service Manual.</li> <li>Check the EPR fuel pressure. Refer to the <i>LPG Fuel System Diagnosis</i>.</li> <li>Check mixer assembly for proper installation and connection.</li> </ul>
Ignition System Checks	<ul> <li>Check for the proper ignition output voltage using the spark tester <i>J26792</i> or the equivalent.</li> <li>Verify that the spark plugs are the correct type and properly gapped.</li> <li>Remove the plugs and inspect them for the following conditions: <ul> <li>Wet plugs.</li> <li>Cracks.</li> <li>Wear.</li> <li>Improper gap.</li> <li>Burned electrodes.</li> <li>Blistered insulators.</li> <li>Heavy deposits.</li> </ul> </li> <li>Check the spark plug wires by connecting an ohmmeter to the ends of each wire in question. If the meter reads over 30,000 ohms, replace the wires.</li> </ul>
Additional Checks	<ul> <li>Important: The LPG Fuel system is more sensitive to intake manifold leakage than the gasoline fuel supply system.</li> <li>Check for vacuum leaks. Vacuum leaks can cause a higher than normal idle and low throttle angle control command.</li> <li>Check the ECM grounds for being clean, tight, and in their proper locations. Check the battery cables and ground straps. They should be clean and secure. Erratic voltage may cause all sensor readings to be skewed resulting in poor idle quality.</li> </ul>

### ROUGH, UNSTABLE, OR INCORRECT IDLE, STALLING

Checks	Action
Engine Mechanical Check	<ul> <li>Check the engine for:</li> <li>Broken motor mounts.</li> <li>Improper valve timing.</li> <li>Low compression.</li> <li>Improper valve clearance.</li> <li>Worn rocker arms.</li> <li>Broken or weak valve springs.</li> <li>Worn camshaft lobes.</li> </ul>

#### **BLINK CODE FUNCTION**

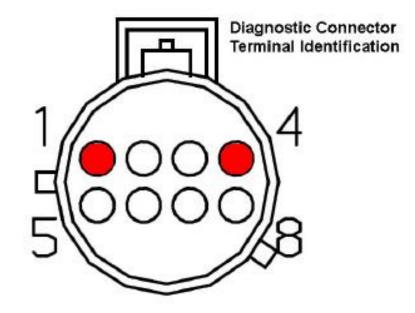

Although the DST is considered a required tool to access the DTC codes, codes may be retrieved without a laptop computer using the blink code function. To enable this function follow the steps below:

- Jump pins 1 and 4 at the DLC connector (see illustration below)
- Turn the ignition key to the on position
- The system will now enter the self diagnostic blink code mode. Be ready with pen and paper to write down any codes that may be stored.
- The ECM will flash the MIL indicator with a pause between represented numbers that represent DTC codes. The sequence starts with code 1654. Code 1654 confirms the system has entered the blink code mode. The ECM will flash code 1654 (3) times before displaying the actual DTC code that may be set.

#### Example:

## <u>One short blink</u> (pause) <u>six short blinks</u> (pause) <u>five short blinks</u> (pause) <u>four short blinks</u>.

- If no DTC codes are found, the ECM will continue to flash 1654 only. This means no stored DTC codes were found.
- If one of the numbers in the DTC code is zero (0), no flash will occur to represent the zero value—it will be represented as a short pause.

Diagram 1

When using the DST program to clear a DTC, always select the "Clear All Faults" function to immediately turn the MIL OFF after a successful repair (as shown in diagram 1 above).

#### INTERMITTENT PROBLEMS

Intermittent fuel system problems can prove to be the most challenging to repair. It is most important to remember when looking to find the cause of these problems, to operate the system in the condition when and where the problem occurs. An example of this would be, if the DST showed a lean fuel mixture at full load, one of the first things to look at would be the fuel pressure. The fuel pressure would need to be monitored while the machine is operating at full load, not at idle because the leaning effect does not occur at idle. Electrical problems should be treated the same way. One excellent tool for finding intermittent electrical problems is the DST plot/log function. Set up the plot for the code that sets. An example of this would be if an intermittent IAT code set, tag the IAT voltage and watch the plot. While watching the plot, agitate the electrical wire connection at the sensor and ECM connector. The resolution of the plot screen is such that you will be able to see any unstable voltages that you would otherwise not see with a standard DVOM.

Caution should be used when pressure washing the under hood of any electrical system. Avoid direct pressure spray on the system electrical connectors. They are splash proof, but if water is sprayed directly at the connector moisture can become trapped behind the connector seal and cause serious system problems.

Extra care must be taken when probing electrical pins and terminals. Do not bend or spread these terminals as this can also be a source of intermittent problems cause by improper handling of these connectors.

# **Engine Wire Harness Repair**

#### ON-VEHICLE SERVICE WIRE HARNESS REPAIR

The ECM harness electrically connects the ECM to a various components in both the engine and passenger compartments.

Wire harnesses should be replaced with proper part number harnesses. When wires are spliced into a harness, use wire with high temperature insulation only.

Low current and voltage levels are used in the system, so it is important that the best possible bond at all wire splices be made by soldering the splices.

#### CONNECTORS AND TERMINALS

Use care when probing a connector or replacing terminals in them to prevent shorting opposite terminals and damage certain components. Always use jumper wires between connectors, for circuit checking. Do not probe through the Weather-Pack seals with oversized wire probes. Use tachometer adapter J 35812 (or equivalent) which provides an easy hook up of the tach lead. The connector test adapter kit J 35616 (or equivalent), contains an assortment of flexible connectors used to probe terminals during diagnosis. Fuse remover and test tool BT 8616, or equivalent, is used for removing a fuse and to adapt fuse holder, with a meter, for diagnosis. Do not solder oxygen sensor wire terminals as these wire ends are used for the sensors oxygen reference.

Open circuits are often difficult to locate by sight due to dirt, oxidation, or terminal misalignment. Merely wiggling a connector on a sensor, or in the wiring harness, may correct the open circuit condition. This should always be considered, when an open circuit, or failed sensor is indicated. Intermittent problems may also be caused by oxidized or loose connections.

Before making a connector repair, be certain of the type of connector. Weather-Pack and Compact Three connectors look similar, but are serviced differently.

#### REPAIRING TWISTED/SHIELDED CABLE

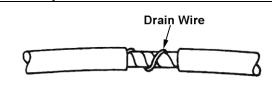

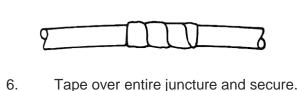

- 1. Remove outer jacket
- 2. Unwrap aluminum/Mylar tape. Do not remove Mylar.

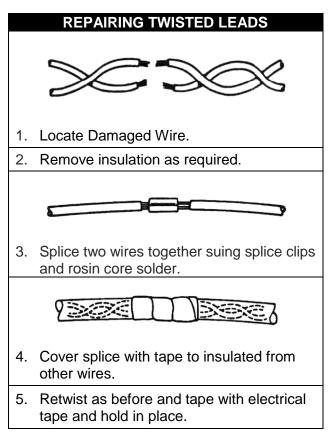

3. Untwist conductors, strip insulation as necessary.

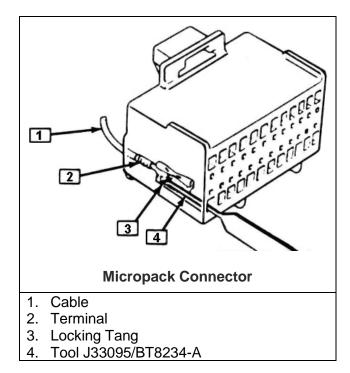

- 4. Splice wire using splice clips and rosin core solder. Wrap each splice to insulate.
- 5. Wrap with Mylar and drain wire (uninsulated) wire.

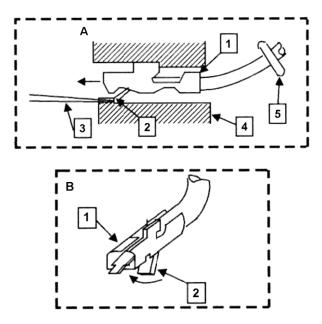

#### **MICRO-PACK**

Refer to Figure 2 and repair procedure for replacement of a Micro-Pack terminal.

#### **METRI-PACK**

Some connectors use terminals called Metri-Pack Series 150. They are also called "Pull-To-Seat" terminals because of the method of installation. The wire is inserted through the seal and connector, the terminal is crimped on the wire and then pulled back into the connector to seat it in place.

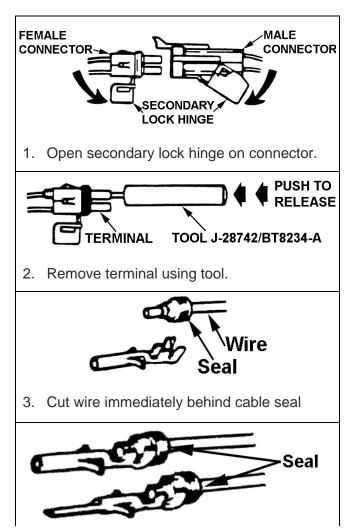

#### Metri-Pack Series 150 Terminal Removal

- 1. Slide the seal back on the wire.
- 2. Insert tool BT-8518, or J 35689, or equivalent, as shown in insert "A" and "B" to release the terminal locking tab (2).
- 3. Push the wire and terminal out through the connector. If reusing the terminal, reshape the locking tab (2).

#### WEATHER-PACK

A Weather-Pack connector can be identified by a rubber seal, at the rear of the connector. The connector is used in the engine compartment to protect against moisture and dirt that may oxidize and/or corrode the terminals. Given the low voltage and current levels found in the electronic system, this protection is necessary to ensure a good connection.

#### WEATHER-PACK TERMINAL REPAIR

- 4. Replace terminal.
  - a. Slip new seal onto wire
  - b. Strip 5 mm (.2") of insulation from wire.
  - c. Crimp terminal over wire and seal.
- 5. Push terminal and connector and engage locking tangs.
- 6. Close secondary lock hinge.

Use tool J M28742, or BT8234-A or equivalent to remove the pin and sleeve terminals. If the removal is attempted with an ordinary pick, there is a good chance that the terminal will be bent, or deformed. Unlike standard blade type terminals, these terminals cannot be straightened once they are bent.

Verify that the connectors are properly seated and all of the sealing rings in place, when connecting leads. The hinge type flap provides a backup, or secondary locking feature for the connector. They are used to improve the connector reliability by retaining the terminals, if the small terminal lock tabs are not positioned properly.

Weather-Pack connections cannot be replaced with standard connections. Additional instructions are provided with Weather-Pack connector and terminal packages.

# 4G Diagnostic Trouble Codes (DTCs)

## Malfunction Indicator Lamp (MIL) Operation

#### How does my MIL work?

The emissions control system utilizes a MIL to warn the operator or technician of a possible issue with the engine or emissions control system. The system will keep the MIL illuminated for the entire key cycle in which the trouble code was set. It will keep the MIL illuminated for three additional engine run cycles under the following two circumstances: (1) The fault caused the engine to shut down or (2) the fault is related to the exhaust gas oxygen (EGO) sensors. This function is called MIL persistence.

#### How does MIL persistence work?

In the event the DTC is related to either an engine shutdown fault OR an oxygen sensor fault the following statement applies: If the vehicle is not serviced by a technician and the condition causing the MIL illumination (DTC) no longer exists, the MIL will remain illuminated for the 3 additional start cycles. The MIL will go out on the 4<sup>th</sup> start cycle if the condition does not reoccur.

In the event the DTC <u>is not</u> related to an engine shut down or an oxygen sensor fault and the condition causing the MIL illumination (DTC) no longer exists, the MIL will go out at the next run cycle.

If the condition is serviced by a technician and the DTC is cleared using a Diagnostic Service Tool (DST), the MIL will go out immediately.

Diagnostic Trouble Codes (DTC) are permanently retained in the historic DTC section until cleared with a DST or the auto clear requirements are met. The auto clear feature will clear out historic faults after 40 run cycles.

#### What are the requirements for a run cycle?

A run cycle is when the engine speed is above the "run speed" set point for 1.5 seconds or longer. The "run speed" is the transition point when the ECM recognizes the engine is going from the cranking parameters to the engine running parameters. The run speed is typically set at 450 rpm.

### DIAGNOSTIC TROUBLE CODE (DTC) CHART – SORTED BY SPN:FMI

### **OBD System Check/MIL (Malfunction Indicator Lamp)**

### **Circuit Description**

The fuel system is equipped with OBD (On-Board Diagnostics). The system has a dash mounted MIL (Malfunction Indicator Lamp). The MIL serves as notification of an engine or fuel system related problem. The MIL also has the ability to flash DTC codes in what is referred to as the blink code mode. It will display DTCs that have been stored due to a possible system malfunction. The following DTC charts in this manual will instruct the technician to perform the OBD system check. This simply means to verify the operation of the MIL. The lamp should illuminate when the key is in the ON position, and the engine is not running. This feature verifies that the lamp is in proper working order. If the lamp does not illuminate with the vehicle key ON and engine OFF, repair it as soon as possible. Once the engine is in start or run mode, the lamp should go off. If the lamp stays on while the engine is in the MIL electrical wiring. The electrical schematic above shows the MIL power source supplied to the lamp. The ECM completes the circuit to ground to turn the lamp ON.

## **OBD System Check**

Step	Action	Value(s)	Yes	No
1	Key ON engine Off		Go to Step (2)	Go to Step (3)
2	<ul><li>Start the engine</li><li>Does the MIL Lamp Turn off?</li></ul>		MIL is work- ing properly. OBD System Check is complete	Go to Step (10)
3	<ul> <li>Key ON engine OFF</li> <li>Check for voltage between MIL power source and engine ground.</li> <li>Do you have voltage?</li> </ul>		Go to Step (4)	Repair MIL voltage source. Refer to OEM body and chassis wiring dia- grams
4	Replace the MIL Lamp Did that solve the problem?		Go to Step (1)	Go to Step (5)
5	<ul> <li>Key OFF</li> <li>Disconnect ECM wire harness connector</li> <li>Using a DVOM check for continuity be- tween MIL side of the customer interface connector and ECM pin 80</li> <li>Do you have continuity?</li> </ul>		Go to Step(6)	Go to Step (8)
6	<ul> <li>Inspect the MIL lamp socket, the customer interface connector, and ECM pin 80 for damage, corrosion, or contamination</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as necessary. Refer to wir- ing repairs section in the manual	Go to Step (7)
7	Replace ECM      Is the replacement complete?		Go to Step (1)	-
8	<ul> <li>Backprobe both MIL and ECM side of terminal G at the customer interface connector</li> <li>Using a DVOM check for continuity through the customer interface connector Do you have continuity?</li> </ul>		Go to Step (9)	Repair the open circuit
9	Inspect the MIL lamp socket, customer in- terface connector, and ECM terminal number 80 for damage, corrosion, or contamination Did you find a problem?		Repair the damaged socket or ter- minal as required	Repair the wire harness open circuit as necessary

10	Active DTC (Diagnostic Trouble Code) is stored in memory. Proceed with DTC diagnosis. If no active DTC is found in ECM memory return to this page step (11)		
	Key is off	Repair the	Go to Step (7)
	Disconnect ECM wire harness con- nector at customer interface connector	shorted ground circuit as neces-	
	• Using a DVOM check for continuity be- tween ECM terminal 80 and battery voltage	sary. Refer to wiring re- pairs in	
11	Do you have continuity?	engine elec- trical	

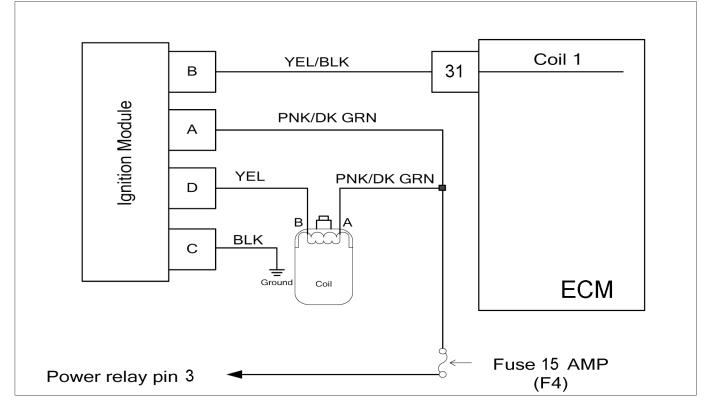

## Starter Circuit System Diagnostics

STEP		Value(s)	Yes	No
1	Remove the back off of the fuse and relay block as- sembly. Locate and inspect all wires/terminals for the starter relay circuit. Insure that al crimps are good and that all terminals are completely engaged into the block. Look for push back terminals or bad crimps.	All Okay	Go to Step (2)	Repair the Wring issue.
2	<ul> <li>Using a DVOM, back probe the starter relay coil terminal 85 to a +12V while cranking the engine</li> <li>Does the DVOM have a 12v signal while cranking?</li> </ul>	12v	Go to Step (3)	Check wire from the relay termi- nal 85 to on 89 on the ECM. Check all termi- nals for spread condition or push back. Repair harness.
3	Using a DVOM, back probe the starter relay coil terminal 86 to a Ground source while cranking the engine	12v	Go to Step (4)	Go 1 step (6)
	Does the DVOM have a 12v signal while cranking?			
4	<ul> <li>Using a DVOM, back probe starter relay contact feed terminal 87 to a Ground source</li> </ul>	12V	Go to Step (5)	Go to step (7)
	Does the DVOM have a 12v signal at all times?			
5	<ul> <li>Using a DVOM, back probe relay contact terminal 30 to a Ground source</li> <li>Does the DVOM have a 12v signal while cranking?</li> </ul>	12V	Go to Step (8)	Replace starter relay
6	<ul> <li>Check terminals at the CIC pin F and terminal 86 at the relay.</li> <li>Check for continuity between pin F at terminal 86 of the relay</li> <li>Do you have continuity? Are the pins fully seated and not spread?</li> </ul>	Yes	Issue with switched 12v supply from OEM. Consult OEM	Repair the wiring issue.
7	<ul> <li>Check circuit between terminal 87 and the 20A starter fuse.</li> <li>Check for pushed back pins, broken or cracked fuses.</li> <li>Did the circuit have a fault between terminal 87 and the 20A fuse?</li> </ul>		Repair the fault in the circuit	Possible internal harness issue.

8	<ul> <li>Check circuit between terminal 30 at the relay and the starter solenoid</li> <li>Check terminal 30 for spread terminals and pushback</li> </ul>	Replace Starter	Repair the wiring issue.
	Is the circuit between terminal 30 and the starter okay?		

### **HVS Ignition Control System Diagnostics**

### 4.3L, 5.0L, 5.7L - SHOWN BELOW

#### Before using the Ignition Control Diagnostic chart be sure to check the following items:

#### Spark plug wires:

Be sure spark plug wires are in good condition. Check for cuts, breaks, burns, hardness or swelling. LPG fuel requires much higher peak firing voltages compared to gasoline. Check spark pug electrical continuity using a DVOM. Wires should ohm out to no more than 1,000 ohms per foot of wire length.

#### Distributor cap and rotor:

Check the cap and rotor assembly for moisture, corrosion or carbon tracking. The ignition timing is not adjustable. Turning the distributor assembly will not change the ignition timing, but will alter the rotor phase. Wipe away dust and debris from the ignition coil tower.

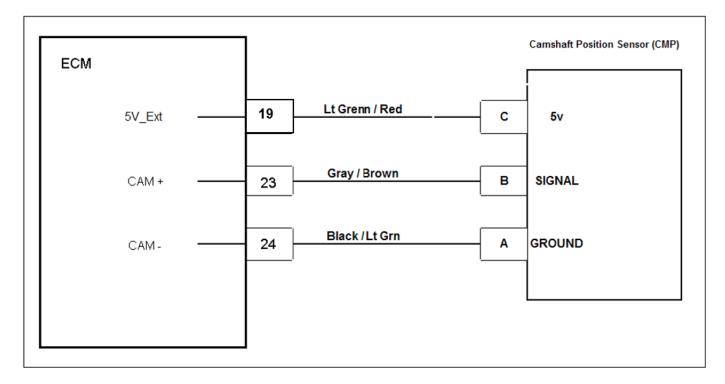

#### System power fuses:

Check the system power fuses. These sources supply the ignition coil and module system power. Check that the power and ground terminals are clean and in the proper location.

# Ignition Control System Diagnostic Chart

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD Sys- tem Check Section
2	<ul> <li>DST connected and in the system data mode.</li> <li>Crank the engine and observe the engine speed signal on the DST</li> <li>Is the value greater than the specified value?</li> </ul>	125 RPM	Go to Step (5)	Go to Step (3)
3	<ul> <li>Check the DST for historical code sets. (Always diagnose and repair codes with the lowest numerical value first).</li> <li>Run the diagnostic chart for DTC 337 Did you find and correct the problem?</li> </ul>		Go to Step (16)	Go to Step (4)
4	• Run the diagnostic chart for DTC 342 Did you find and correct the problem?		Go to Step (16)	Go to Step (5)
5	<ul> <li>Disconnect the ignition module connector C011</li> <li>Using an LED type test lamp check for a sig- nal between the ignition module connector pin B and battery positive</li> <li>Crank the engine Does the LED test lamp flash while cranking the engine?</li> </ul>		Go to Step(6)	Go to Step (10)
6	<ul> <li>Using a DVOM check for power between the ignition module connector pin A and engine ground</li> <li>Do you have power?</li> </ul>		Go to Step (7)	Repair the sys- tem power circuit. Check all system fuses and power relay connections
7	<ul> <li>Disconnect the ignition coil connector C009</li> <li>Using a digital LED test lamp check for a signal between the ignition coil connector pin B and battery positive</li> <li>Crank the engine Does the LED test lamp flash while cranking the engine?</li> </ul>		Go to Step (8)	Go to Step (13)
8	<ul> <li>Using a DVOM check for voltage between the ignition coil connector pin A and engine ground</li> <li>Does the DVOM show voltage?</li> </ul>	System volt- age	Go to Step (9)	Repair the sys- tem power circuit. Check all system fuses and power relay connections
9	<ul> <li>Replace the ignition coil Is the replacement complete?</li> </ul>		Go to Step (16)	-

Step	Action	Value(s)	Yes	No
10	<ul> <li>Key OFF</li> <li>Disconnect the ECM connector C001</li> <li>Using a DVOM check for continuity between ignition module connector pin B and ECM connector pin 31</li> <li>Do you have continuity between them?</li> </ul>		Go to Step (11)	Repair the open ignition control circuit. See wir- ing harness repair section.
11	<ul> <li>Using a DVOM check for continuity between ignition module connector pin B and engine ground</li> <li>Do you have continuity between them?</li> </ul>		Repair the shorted to ground igni- tion control circuit. See wiring harness repair section.	Go to Step (12)
12	Replace ECM Is the replacement complete?		Go to Step (16)	-
13	<ul> <li>Disconnect coil. Using a DVOM check for continuity between the ignition module con- nector pin C and engine ground</li> <li>Do you have continuity?</li> </ul>		Go to Step (14)	Repair the open ignition module ground circuit. See wring har- ness repair.
14	<ul> <li>Using a DVOM check for continuity between the ignition module connector pin D and igni- tion coil connector pin B</li> <li>Do you have continuity?</li> </ul>		Go to Step (15)	Repair the open ignition module circuit. See wir- ing harness repair.
15	<ul> <li>Replace the ignition module.</li> <li>Is the replacement complete?</li> </ul>		Go to Step (16)	-
16	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD Sys- tem Check

DTC 11 – Intake cam / distributor position error (SPN 520800:FMI 7)

### Conditions for setting the DTC

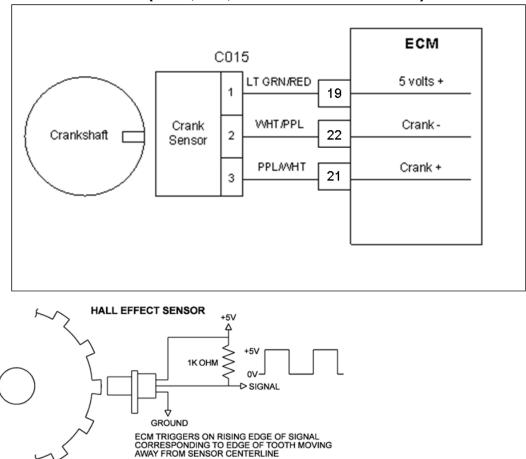

- Camshaft Position sensor
- Check Condition- Engine cranking
- Fault Condition- Engine RPM's greater than 2,000 and difference between the desired CAM position and actual CAM position is greater than 30 CAD
- MIL Command-ON

#### **Circuit Description**

The CAM position sensor is utilized to distinguish the cylinder event (compression or exhaust), thus making the cylinder identification available to the ECM. The camshaft position sensor is a 3 wire hall effect sensor. One wire for current feed (5v), one for ground, and one for the output signal (CAM 1). The sensor must have a good 5v reference and ground to operate properly. The CAM position and CAM Position desired value is displayed on the "TESTS" page in the GCP display software. This code will set when these two values are more than 30 CAD BTDC apart.

To change the CAM position you should rotate the distributor. If rotating the distributor does not correct the issue you should troubleshoot sensor, wiring, and ECM for issues.

### DTC 16-Never Crank Synchronized at Start (SPN 636:FMI 8)

### (4.3L, 5.0, & 5.7L Shown Below)

## Conditions for setting the DTC

- Crankshaft Position sensor
- Check Condition- Engine cranking
- Fault Condition- Cranking rpm above 90 and more than 4 cranking revolutions without synchronization
- Adaptive Disabled
- MIL Command-ON

#### **Circuit Description**

The Crankshaft position sensor is a 5 volt powered sensor mounted to the lower front engine block. A pulse wheel located on the crankshaft is used to measure engine rpm and its signal is used to synchronize the ignition and fuel systems. This fault will set if the ECM detects cranking revolutions without synchronization of the CMP and CKP sensors.

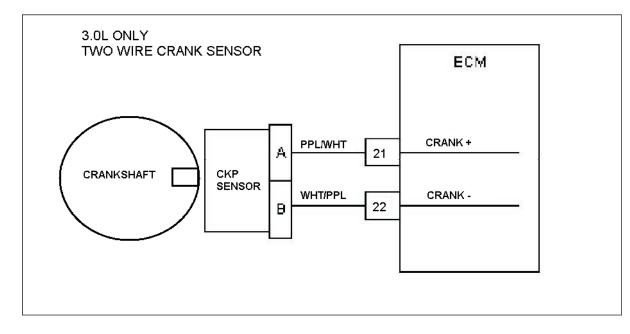

Reversed sensor wires, poor wire connections or a faulty system ground are most frequently the cause of this code set.

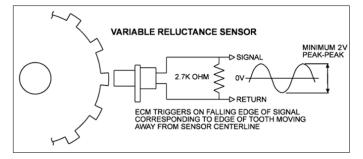

## DTC 16-Never Crank Synchronized at Start (SPN 636:FMI 8)

Stop	Action	Value(s)	Yes	No
Step 1	Did you perform the On-Board (OBD) System Check?		Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Check that the ECM ground terminals C010, C022 and C023 are clean and tight Are the ground terminals clean and tight?</li> </ul>		Go to Step (3)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
3	<ul> <li>Key On, Engine OFF</li> <li>Disconnect the CKP (Crankshaft position) Sensor connector C015</li> <li>Using A DVOM check for voltage at the CKP sensor connector pin 1 and engine ground (CHECK THIS BEFORE THE POWER RELAY SHUTS OFF)</li> <li>Do you have voltage?</li> </ul>	5.0 volts	Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	<ul> <li>Key OFF</li> <li>Disconnect ECM connector C001</li> <li>Using a DVOM check for continuity between CKP connector pin 2 and ECM connector pin 22</li> <li>Do you have continuity between them?</li> </ul>		Go to Step (5)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
5	<ul> <li>Using a DVOM check for continuity between CKP connector pin 3 and ECM connector pin 21</li> <li>Do you have continuity between them?</li> </ul>		Go to Step (6)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
6	<ul> <li>Inspect the CKP connector C015 terminals for damage, corrosion or contamination</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.	Go to Step (7)
7	<ul> <li>Inspect the ECM connector C001 terminals 19, 21 and 22 for damage, corrosion or con- tamination</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.	Go to step (8)

Step	Action	Value(s)	Yes	No
8	Replace CKP sensor Is the replacement complete?		Go to Step (10)	-
9	Replace ECM Is the replacement complete?		Go to Step (11)	-
10	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-16 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to Step (9)
11	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-16 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### DTC 16-Never Crank Synced At Start (3.0L ONLY) (SPN 636:FMI 8)

### **Conditions for setting the DTC**

- Crankshaft Position sensor
- Check Condition- Engine cranking
- Fault Condition- Cranking RPM above 90 and more than 4 cranking revolutions without sync
- MIL Command-ON

### NOTE: The 3.0L engine has a 2 wire Variable Reluctance Sensor

#### **Circuit Description**

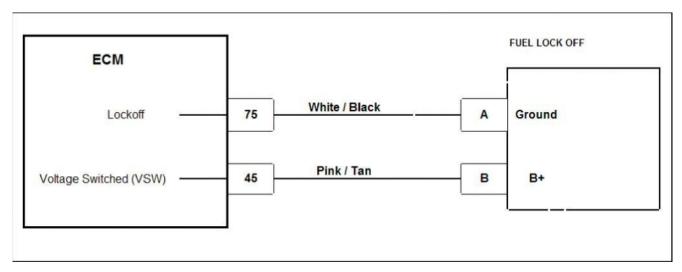

The CKP (crankshaft position sensor) is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. It determines crankshaft position by monitoring the pulse wheel. The Crankshaft Position sensor is used to measure engine RPM and its signal is used to synchronize the ignition and fuel systems. This fault will set one or

more crank re-sync occur within 800 ms.

## DTC-57 EGOH4 Open/Ground Short (SPN 3271:FMI 4)

### **Conditions for Setting the DTC**

- LPG lock-off valve
- Check Condition-Engine Cranking
- Low side voltage is less than 5.0v
- MIL-ON

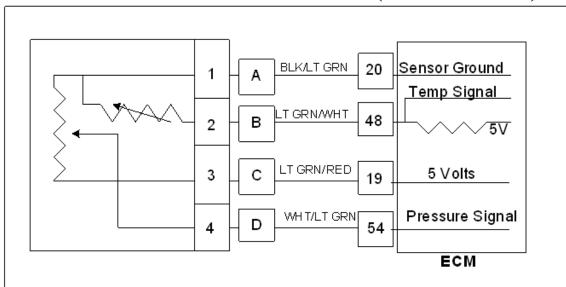

### **Circuit Description**

The LPG lock off value is supplied battery power through the VSW circuit. The ECM then provides a path to ground to open the value. This fault will set if the ECM detects a low voltage on the low side when the lock-off value "off".

# DTC-57 EGOH\_4 Open/Ground Short

DTC 87 – Fuel Pressure Low (SPN 94:FMI 1)

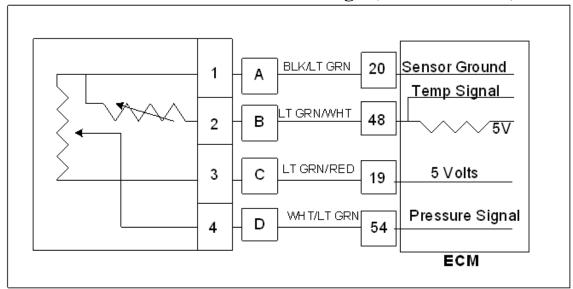

#### **Conditions for setting the DTC**

- Fuel Pressure is less than 55 psia
- Fault must be active for 3.0 seconds to activate DTC
- MIL light on during fault
- Forced idle is enabled

#### **Circuit Description**

This engine is equipped with a fuel injector rail that does not have a pressure regulator or a return circuit to the fuel tank. Fuel pressure for this engine is regulated by the engine's ECM. The ECM receives fuel pressure and temperature feedback from the gasoline fuel sensor manifold and uses this information to control the ground side of the fuel pump. Fuel pressure is regulated by the ECM pulse width modulating (PWM) the fuel pump. The fuel pressure and temperature sensor manifold has a return or "bleed" circuit that connects back to the equipment fuel tank. This circuit is used to bleed off any vapor that develops in the line and returns a small amount of fuel to the tank. The fuel comes from the fuel tank and passes through the fuel pump. Fuel exits the fuel pump, passes through the filter and then enters the fuel pressure and temperature manifold assembly. Fuel flows through the feed circuit and is delivered to the fuel injector rail. Fuel that enters the bleed circuits through the by-pass valve in the manifold is returned to the fuel tank.

DTC 88 – Fuel Pressure High (SPN 94:FMI 0)

#### **Conditions for setting the DTC**

- Fuel Pressure is greater than 90 psia
- Fault must be active for 3.0 seconds to activate DTC
- MIL light on during fault
- Forced idle is enabled

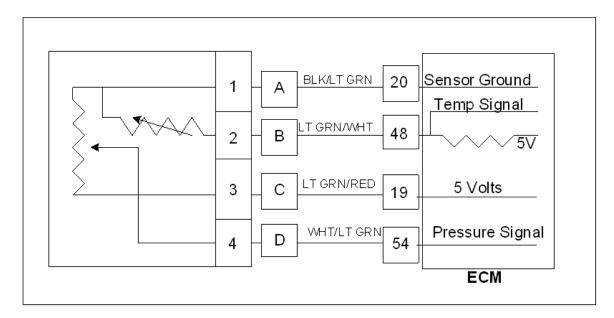

#### **Circuit Description**

This engine is equipped with a fuel injector rail that does not have a pressure regulator or a return circuit to the fuel tank. Fuel pressure for this engine is regulated by the engine's ECM. The ECM receives fuel pressure and temperature feedback from the gasoline fuel sensor manifold and uses this information to control the ground side of the fuel pump. Fuel pressure is regulated by the ECM pulse width modulating (PWM) the fuel pump. The fuel pressure and temperature sensor manifold has a return or "bleed" circuit that connects back to the equipment fuel tank. This circuit is used to bleed off any vapor that develops in the line and returns a small amount of fuel to the tank. The fuel comes from the fuel tank and passes through the fuel pump. Fuel exits the fuel pump, passes through the filter and then enters the fuel pressure and temperature manifold assembly. Fuel flows through the feed circuit and is delivered to the fuel injector rail. Fuel that enters the bleed circuits through the by-pass valve in the manifold is returned to the fuel tank.

# DTC 88 – Fuel Pressure High

STEP	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Section
2	<ul> <li>Key On</li> <li>DST (Diagnostic Scan Tool) connected</li> <li>On the FAULTS page, check the value for fuel rail pressure</li> <li>Does the DST display 90 psia or greater?</li> </ul>	90 psia or greater	Go to Step (3)	Intermittent problem. Go to intermittent section
3	Check the fuel pressure using a manual fuel pressure gauge Does the manual gauge display 90 psi or greater?	90 psia or greater	Go to Step (4)	Go to step (5)
4	Check for a short to ground in the fuel pump ground circuit (OEM supplied)  Is the ground circuit shorted to a ground?		Repair the short to ground	Go to step (6)
5	<ul> <li>Jumper pins C and D at the fuel pressure sensor connector</li> <li>Monitor the FRP_Raw volts on the VOLTAGE page.</li> <li>Does FRP_Raw display 5 volts?</li> </ul>	5 volts	Replace the Fuel pressure Sensor	Repair the wiring between the fuel pump pressure sensor and the ECM
6	<ul> <li>Check the OEM fuel hoses for proper installation and routing</li> <li>Check the OEM fuel hoses for blockages</li> <li>Were the OEM fuel hoses improperly installed or have a blockage?</li> </ul>		Repair the OEM fuel hose issue	Replace ECM

### DTC 91-Gasoline Fuel Pressure Sensor Low Voltage (SPN 94: FMI 4)

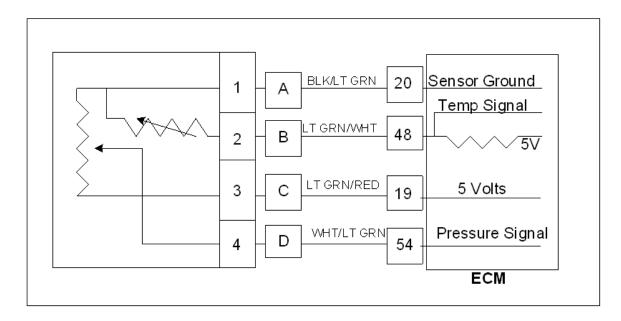

### Conditions for Setting the DTC

- Gasoline fuel temperature sensor voltage
- Fuel pressure sensor voltage less than 0.2v for greater than 1 second
- MIL-On for active fault and for 2 seconds after active fault
- Adaptive Learn is disabled during fault condition
- Forced idle is enabled

#### **Circuit Description**

Note: The fuel pressure and temperature sensor is wired via Equipment Manufacturer supplied harness jumper. The terminals A, B, C, D & 19, 20, 48, 54 are engine wiring harness terminals at the fuel sensor interface connector C002 and the ECM header connector C001. You may need to consult additional wiring information supplied by the OEM. The gasoline fuel pressure sensor voltage is read at less than 0.2v. This indicates a low voltage fault from the sensor or circuit. This fault can occur when a ground is lost on the black/Lt Green circuit.

## DTC 92-Gasoline Fuel Pressure Sensor High Voltage (SPN 94:FMI 3)

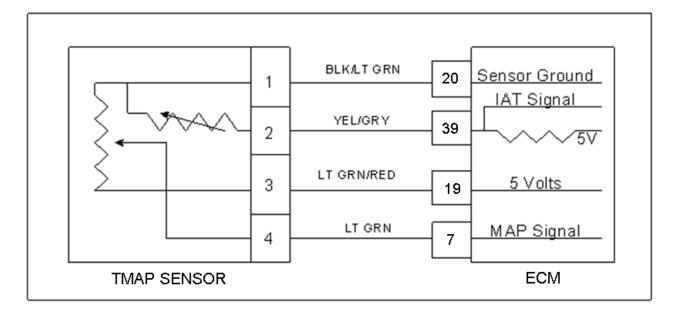

### Conditions for Setting the DTC

- Gasoline fuel temperature sensor voltage
- Fuel pressure sensor voltage greater than 4.8v for greater than 1 second
- MIL-On for active fault and for 2 seconds after active fault
- Adaptive Learn is disabled during fault condition
- Forced Idle is enabled

### **Circuit Description**

Note: The fuel pressure and temperature sensor is wired via Equipment Manufacturer supplied harness jumper. The terminals A, B, C, D & 19, 20, 48, 54 are engine wiring harness terminals at the fuel sensor interface connector C002 and the ECM header connector C001. You may need to consult additional wiring information supplied by the OEM. The gasoline fuel pressure sensor voltage is reading greater than 4.8v. This indicates a high voltage fault from the sensor or circuit.

## DTC 107-MAP Low Voltage (SPN 106:FMI 4)

### **Conditions for Setting the DTC**

- Manifold Absolute Pressure Sensor
- Check Condition-Engine cranking or running
- Fault Condition-MAP voltage less than 0.050 with throttle position greater than 2.0% and engine RPM less than 3000.
- MIL-ON
- Adaptive-Disabled
- Fueling is based on RPM and TPS Limp-Home Condition during this fault.

### **Circuit Description**

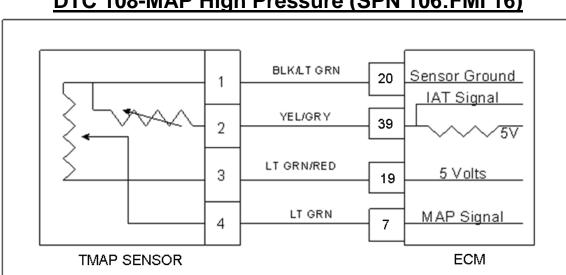

The Manifold Absolute Pressure sensor is a pressure transducer connected to the intake manifold. It is used to measure the pressure of air in the manifold prior to induction. The pressure reading is used in conjunction with other inputs to estimate the airflow rate to the engine, which determines the fuel flow rate. This fault will set if the MAP voltage is less than 0.050 with TPS greater than 2% and engine RPM is less than 3000. The Adaptive Learn will be disabled for the remainder of the key on cycle and the MIL command is on.

## DTC 108-MAP High Pressure (SPN 106:FMI 16)

### Conditions for Setting the DTC

- MAP pressure test
- Check condition-engine running
- Fault Condition-MAP greater than 17.00 psia with TPS less than 10% and engine rpm greater than 800.
- MIL-ON
- Adaptive-disabled

### **Circuit Description**

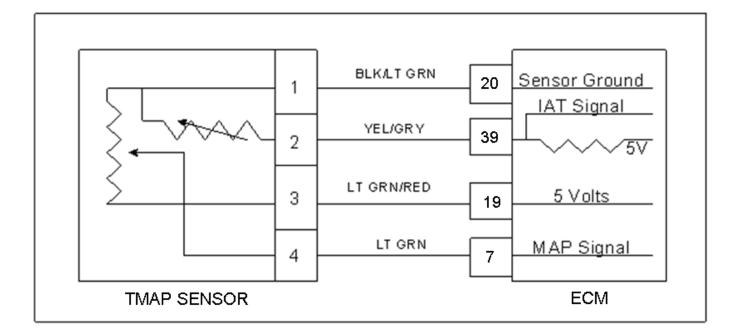

The MAP (Manifold Absolute Pressure) is estimated from the MAP sensor. The MAP pressure value is used for fuel, airflow and spark calculations. This fault will set in the event the MAP value is greater than 17.00 psia when the TPS is less than 10% with engine rpm greater than 800.

# DTC 108-MAP High Pressure

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine running at full operating temperature.</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Does DST display MAP pressure of 17 psia or greater with the engine running above 800 rpm with a TPS value less than 10%?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section

## DTC 111-IAT Higher Than Expected 1 (SPN 105:FMI 15)

### Conditions for Setting the DTC

- Intake Air Temperature
- Check Condition-Engine Running
- Fault Condition-Intake Air Temperature greater than 200 degrees F. with engine rpm greater than 700
- Condition must be present for a minimum of 60 seconds
- MIL-ON
- Adaptive-Disabled during active fault
- Derate level 1 will occur

### **Circuit Description**

The TMAP is a combined IAT (Intake Air Temperature) and MAP (Manifold Absolute Pressure) sensor. A temperature sensitive resistor is used in the TMAP located in the air intake manifold of the engine. It is used to monitor incoming air temperature, and the output in conjunction with other sensors is used to determine the airflow to the engine. The ECM provides a voltage divider circuit so that when the air is cool, the signal reads higher voltage, and lower when warm. This fault will set if the Intake Air Temperature is greater than 200 degrees F. with engine speed greater than 700 rpm. The engine will go into a level 1 derate mode to prevent engine damage.

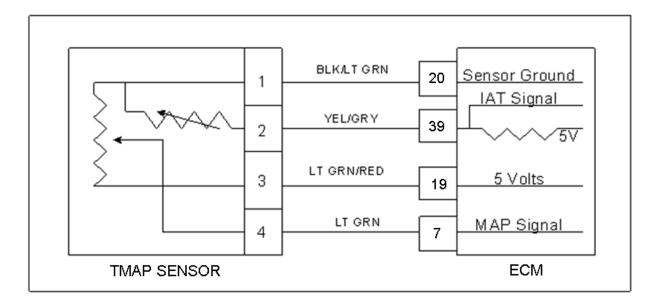

## DTC 111-IAT Higher Than Expected 1 (SPN 105:FMI 15)

### **Diagnostic Aid**

This fault will set when inlet air is much hotter than normal. The most common cause of high inlet air temperature is a problem with the inlet air system.

- Ensure that the air inlet is not obstructed, modified or damaged.
- Inspect the air inlet system for cracks or breaks that may allow unwanted under hood air in to the air inlet system
- If none of the above can be found, follow the diagnostic steps for DTC 112-IAT Low Voltage.

## DTC 112-IAT Low Voltage (SPN 105:FMI 4)

### **Conditions for Setting the DTC**

- Intake Air Temperature
- Check Condition Engine Cranking or Running
- Fault Condition-IAT Sensor Voltage less than 0.050
- MIL-ON during active fault
- Adaptive-Disabled during active fault

### **Circuit Description**

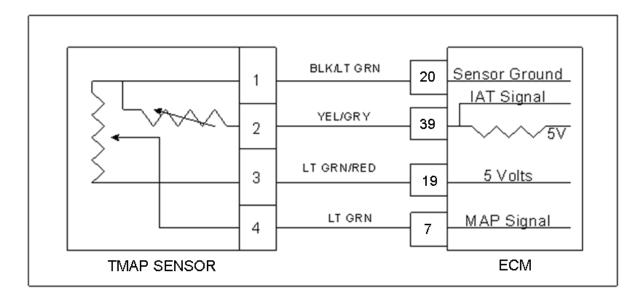

The TMAP is a combined IAT (Intake Air Temperature) and MAP (Manifold Absolute Pressure) sensor. A temperature sensitive resistor is used in the TMAP is located in the engine's air intake or intake manifold. It is used to monitor incoming air temperature, and the output in conjunction with other sensors is used to determine the airflow to the engine. The ECM provides a voltage divider circuit so that when the air is cool the signal reads higher voltage, and lower when warm. This fault will set if the signal voltage is less than 0.050 volts for 1 second anytime the engine is cranking or running. The ECM will use the default value for the IAT sensor in the event of this fault.

## DTC 116-ECT Higher Than Expected 1 (SPN 110:FMI 15)

#### **Conditions for Setting the DTC**

- Engine Coolant Temperature
- Check Condition-Engine Running
- Fault Condition-Engine Coolant Temperature reading or estimate greater than 236 degrees F. for greater than 20 seconds
- MIL-On
- Power derate (level 1)
- Adaptive-Disabled during active fault

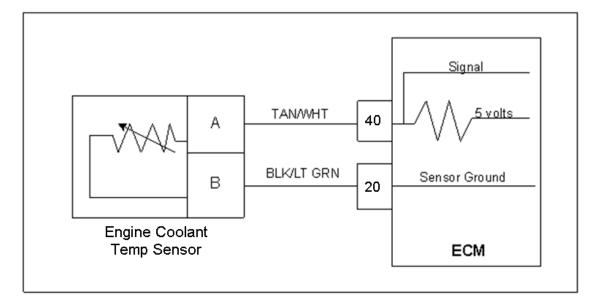

#### **Circuit Description**

The ECT (Engine Coolant Temperature) sensor is a temperature sensitive resistor located in the engine coolant sensor that is located in the coolant passage. The ECT is used for engine airflow calculation, fuel enrichment, and ignition timing control and to enable certain other temperature dependant operations. This code set is designed to help prevent engine damage from overheating. The ECM provides a voltage divider circuit so when the sensor reading is cool the sensor reads higher voltage, and lower when warm. This fault will set when the coolant exceeds 236 degrees F. for more than 20 seconds. Power derate level one will be enforced during this fault limiting the maximum throttle position to 50%.

# DTC 116-ECT Higher Than Expected 1

STEP	Action	Value(s)	Yes
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)
	<ul> <li>Key ON</li> <li>DST (Diagnostic Scan Tool) connected in system data mode</li> </ul>		Go to Step (3)
2	Warm engine to normal operating temperature, then run the engine above 1200 rpm for at least 60 seconds		
	Does the DST display ECT temperture of 236 degrees F or greater?		
3	Verify with a temperature gauge that the engine coolant is over 236 degrees F.		Repair cooling system.
	Does the temperature gauge indicated 236 degrees F. or greater?		
4	Verify ECT Circuit function. Follow diagnostic test procedure for DTC 217 (ECT Higher than expected 2)		-

## DTC 117-ECT/CHT Low Voltage (SPN 110:FMI 4)

#### **Conditions for Setting the DTC**

- Engine Coolant Temperature
- Check Condition-Engine Running
- Fault Condition-ECT sensor voltage less than 0.050
- MIL-ON during active fault
- Adaptive-Disabled during active fault

#### **Circuit Description**

The ECT (Engine Coolant Temperature) sensor is a temperature sensitive resistor located in the engine coolant passage. It is used for the engine air-flow calculation, cold fuel enrichment and to enable other temperature dependant features. The ECM provides a voltage divider circuit so that when the coolant is cool, the signal reads higher voltage, and lower when warm (see table). This fault will set if the signal voltage is less than 0.050 volts for any period longer than 1 second. The ECM will use a default value for the ECT sensor in the event of this fault.

## DTC 121-TPS 1 Lower Than TPS 2 (SPN 51:FMI 1)

### Conditions for Setting the DTC

- Throttle Position Sensor 1 & 2
- Check Condition-Key ON
- Fault Condition-TPS 1 20% lower than TPS 2
- MIL-ON for remainder of key on cycle
- Engine shutdown

#### **Circuit description**

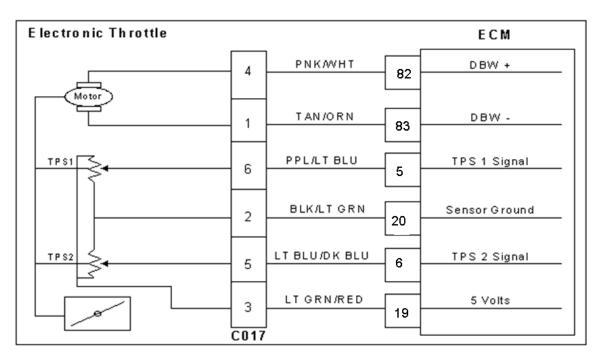

Dual throttle Position Sensors are used within the throttle that use variable resistors to determine signal voltage based on throttle plate position. TPS 1 will read low voltage when closed and TPS 2 will read high voltage when closed. The TPS 1 and TPS 2 percentages are calculated from these voltages. Although the voltages are different, the calculated values for the throttle position percentages should be very close to the same. The TPS values are used by the ECM to determine if the throttle is opening as commanded. This fault will set if TPS 1 is 20% (or more) lower than TPS 2. At this point the throttle is considered to be out of specification, or there is a problem with the TPS signal circuit. The MIL command is on and the engine will shutdown.

# DTC 121 TPS 1 Lower Than TPS 2

Step	Action	Value(s)	Yes	No

12	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-121 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 122-TPS 1 Low Voltage (SPN 51:FMI 4)

### Conditions for Setting the DTC

- Throttle Position Sensor 1
- Check Condition-Cranking or Running
- Fault Condition-TPS sensor less than 0.200 volts
- MIL-ON during active fault
- Engine shutdown

#### **Circuit Description**

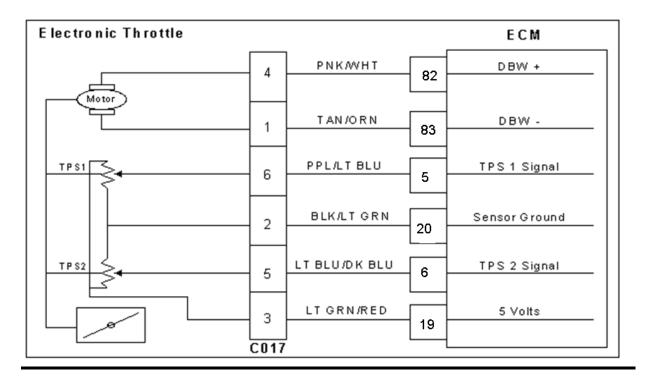

Dual throttle Position Sensors are used within the throttle that use variable resistors to determine signal voltage based on throttle plate position. TPS1 will read lower voltage when closed and TPS2 will read higher voltage when closed. The TPS1 and TPS2 percentages are calculated from these voltages. Although the voltages are different, the calculated values for the throttle position percentages should be very close to the same. The TPS values are used by the ECM to determine if the throttle is opening as commanded. The TPS is not serviceable and in the event of a failure the electronic throttle assembly must be replaced. This fault will set if the TPS 1 voltage is less than 0.200 volts. The MIL command is ON and the engine will shut down.

# DTC 122 TPS 1 Signal Voltage Low

Step	Action	Value(s)	Yes	No

3	<ul> <li>Slowly depress Foot Pedal while observing TPS 1 voltage</li> <li>Does TPS 1 voltage ever fall below 0.200 volts?</li> </ul>		Go to Step (4)	Intermittent problem Go to Intermit- tent section
4	<ul> <li>Key OFF</li> <li>Disconnect the electronic throttle connector C017</li> <li>Jump the 5 volt reference circuit pin 3 and TPS 1 signal circuit pin 6 together at the throttle connector</li> <li>Key ON</li> <li>Does DST display TPS 1 voltage of 4.0 volts or greater?</li> </ul>		Go to Step (7)	Go to Step (5)
5	<ul> <li>Key OFF</li> <li>Disconnect ECM wire harness connector C001</li> <li>Using a DVOM check continuity between the electronic throttle connector signal pin 6 and ECM connector TPS 1 signal pin 5</li> <li>Do have continuity between them?</li> </ul>		Go to Step (6)	Repair the cir- cuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.
6	Replace ECM Is the replacement complete?		Go to Step (9)	-
7	<ul> <li>Inspect the throttle wire harness connector terminals for damage, corrosion or contami- nation</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.	Go to Step (8)
8	<ul> <li>Replace the electronic throttle Is the replacement complete?</li> </ul>		Go to Step (9)	-

Step	Action	Value(s)	Yes	Νο
9	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-122 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 123-TPS 1 High Voltage (SPN 51:FMI 3)

### Conditions for Setting the DTC

- Throttle Position Sensor 1
- Check Condition-Cranking or Running
- Fault Condition-TPS sensor voltage exceeds 4.800 volts
- MIL-ON during active fault
- Engine shutdown

### **Circuit Description**

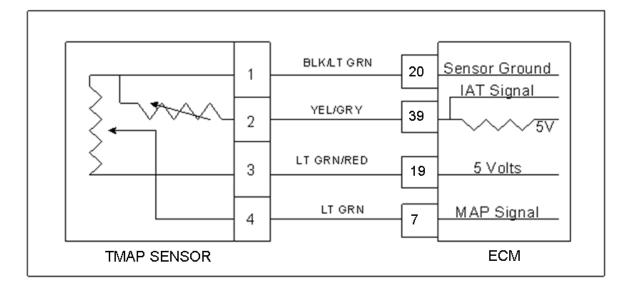

Dual throttle Position Sensors are used within the throttle that use variable resistors to determine signal voltage based on throttle plate position. TPS1 will read lower voltage when closed and TPS2 will read higher voltage when closed. The TPS1 and TPS2 percentages are calculated from these voltages. Although the voltages are different, the calculated values for the throttle position percentages should be very close to the same. The TPS values are used by the ECM to determine if the throttle is opening as commanded. The TPS is not serviceable and in the event of a failure the electronic throttle assembly must be replaced. This fault will set if the TPS 1 voltage exceeds 4.800 volts. The MIL command is ON and the engine will shut down.

## DTC 123 TPS 1 Signal Voltage High

Step	Action	Value(s)	Yes	Νο
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Section
2	<ul> <li>Key ON, Engine OFF</li> <li>DST (Diagnostic Scan Tool) connected</li> <li>Does the DST display TPS 1 voltage of 4.800</li> <li>volts or greater with the throttle closed?</li> </ul>		Go to Step (4)	Go to Step (3)
3	<ul> <li>Slowly depress Foot Pedal while observing TPS 1 voltage</li> <li>Does TPS 1 voltage ever exceed 4.800 volts?</li> </ul>		Go to Step (4)	Intermittent problem Go to Intermit- tent section
4	<ul> <li>Key OFF</li> <li>Disconnect electronic throttle connector</li> <li>Key ON</li> <li>Does DST display TPS 1 voltage less than 0.2 volts?</li> </ul>		Go to Step (7)	Go to Step (5)
5	<ul> <li>Key OFF</li> <li>Disconnect ECM wire harness connector C001</li> <li>Key ON</li> <li>Using a DVOM check for voltage between TPS 1 signal at the ECM connector pin 5 and engine ground</li> <li>Do you have voltage?</li> </ul>		Repair the circuit as nec- essary. 9	Replace the electronic throttle     Is the replacement complete?		Go to Step (11)	-
10	<ul> <li>Key OFF</li> <li>Disconnect ECM connector C001</li> <li>Using a DVOM check for continuity between the electronic throttle connector sensor ground pin 2 and ECM connector TPS 1 sen- sor ground pin 20</li> <li>Do have continuity between them?</li> </ul>		Go to Step (6)	Repair the cir- cuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.

Step	Action	Value(s)	Yes	Νο
	Remove all test equipment except the DST. Connect any disconnected components, fuses, etc. Using the DST clear DTC information from the ECM. Turn the ignition OFF and wait 30 seconds. Start the engine and operate the vehicle to full operating temperature Observe the MIL Observe engine performance and drivability After operating the engine within the test pa- rameters of DTC-123 check for any stored codes.		System OK	Go to OBD System Check

### DTC 127-IAT Higher Than Expected 2 (SPN 105:FMI 0)

#### Conditions for Setting the DTC

- Intake Air Temperature
- Check Condition-Engine Running
- Fault Condition-Intake Air Temperature greater than 210 degrees F. with engine speed greater than 700 rpm
- Fault condition must be active for longer than 120 seconds
- MIL-ON for active fault
- Engine will de-rate to 1,400 rpms.

### **Circuit Description**

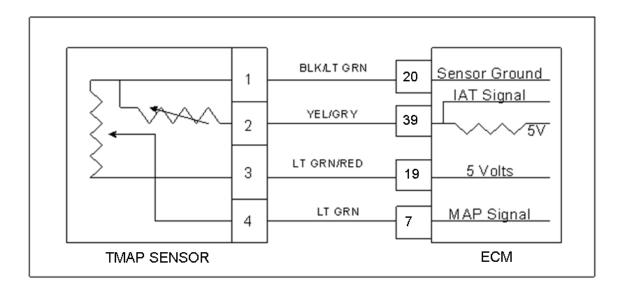

The TMAP is a combined IAT (Intake Air Temperature) and MAP (Manifold Absolute Pressure) sensor. A temperature sensitive resistor is used in the TMAP located in the intake manifold of the engine. It is used to monitor incoming air temperature, and the output in conjunction with other sensors is used to determine the airflow to the engine. The ECM provides a voltage divider circuit so that when the air is cool, the signal reads a higher voltage, and lower when warm. This fault will set if the intake air temperature is greater than 210 degrees F. with engine speed greater than 700 rpm. The MIL light command is on during this active fault and the engine will derate to 1,400 rpms.

## DTC 127-IAT Higher Than Expected 2

### **Diagnostic Aid**

- This fault will set when inlet air is much hotter than normal. The most common cause of high inlet air temperature is a problem with the inlet air system. Ensure that the air inlet is not obstructed, modified or damaged.
- Inspect the air inlet system for cracks or breaks that may allow unwanted under hood air in to the air inlet system
- If none of the above can be found, follow the diagnostic steps for DTC 112-IAT Low Voltage.

### DTC 129-BP Low Pressure (SPN 108: FMI 1)

### **Conditions for Setting the DTC**

- Barometric Pressure
- Check Condition-Key ON
- Fault Condition-BP less than 8.30 psia
- MIL-ON for active fault
- Adaptive-Disabled

#### **Circuit Description**

The BP (Barometric Pressure) is estimated from the TMAP sensor. The barometric pressure value is used for fuel and airflow calculations. This fault sets in the event the BP value is out of the normal range.

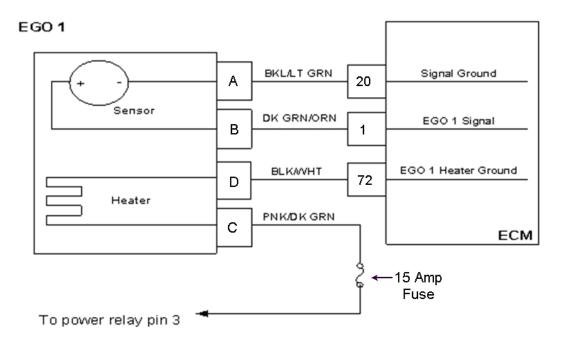

## DTC 129-BP Low Pressure

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON.</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Does DST display BP pressure of 8.30 psia or less?</li> </ul>		Go to Step (3)	Intermittent problem. Go to Intermittent section

### DTC 134-EGO 1 Pre Cat Open/Lazy (SPN 3217:FMI 5)

### Conditions for Setting the DTC

- Heated Oxygen Sensor
- Check condition-Engine running
- Fault condition-EGO 1 pre catalyst persistently cold for more than 120 seconds
- MIL-ON during active fault
- Adaptive-Disabled during active fault
- Closed Loop-Disabled during active fault

### **Circuit Description**

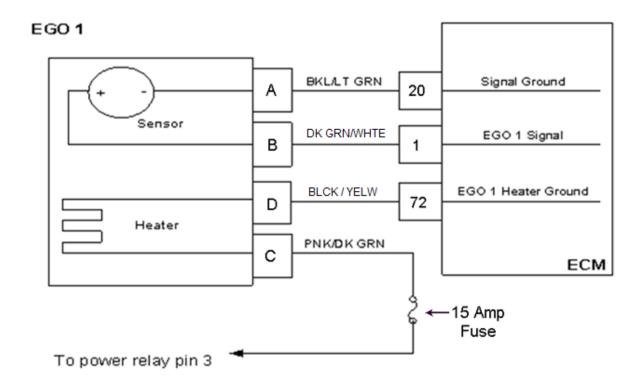

The EGO 1 sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and the Adaptive multiplier. This fault will set if EGO 1 is cold, non-responsive, or inactive for more than 120 seconds.

## DTC 134-EGO 1 Open/Inactive

### DTC 154-EGO 2 Post Cat Open/Lazy (SPN 3227:FMI 5)

- Heated Oxygen Sensor
- Check condition- Engine running
- · Fault condition- EGO 2 cold persistently more than 120 seconds
- MIL- On during active fault and for 1 second after active fault
- Adaptive- Disabled during active fault
- Closed Loop- Disabled during active fault

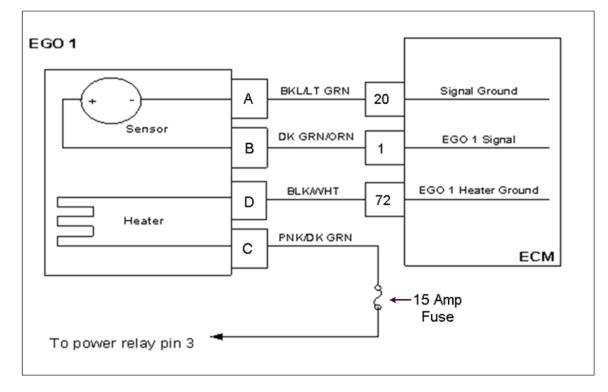

#### **Circuit Description**

The EGO 2 sensor is used to monitor the efficiency of the catalytic converter. The ECM compares the EGO 1 and EGO 2 voltage signals to determine this. This fault will set if EGO 2 is cold, non-responsive, or inactive for more than 120 seconds.

### DTC 171-Adaptive Learn High Gasoline (SPN 4237:FMI 0)

### Conditions for Setting the DTC

- Heated Oxygen Sensor
- Check Condition-Engine Running
- Fault Condition-Adaptive multiplier out of range greater than 30%
- MIL-ON

#### **Circuit Description**

The EGO 1 sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and Adaptive multiplier. This fault will set if the adaptive multiplier exceeds the limits of normal operation. Always run the fuel system diagnostic checks before using the following diagnostic chat.

#### **Diagnostic Aid**

**Oxygen Sensor Wire** Heated Oxygen sensor wires may be mis-routed and contacting the exhaust manifold.

<u>Vacuum Leaks</u> Large vacuum leaks and crankcase leaks can cause a lean exhaust condition at especially at light load.

**<u>Fuel Pressure</u>** Low fuel pressure, faulty fuel pressure sensor, faulty pump, or contaminated fuel filter can cause fuel the system to run lean

**Exhaust Leaks** If there is an exhaust leak, outside air can be pulled into the exhaust and past the 02 sensor causing a false lean condition.

**Fuel Quality** Contaminated or spoiled fuel can cause the fuel system to be lean.

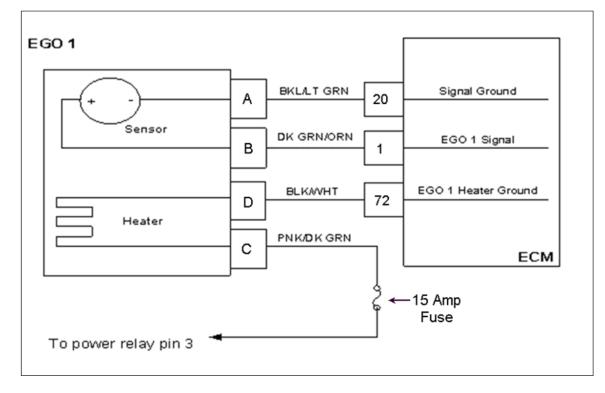

Ground Problem ECM grounds must be clean, tight and in the proper location.

## DTC 171-Adaptive Learn High Gasoline

Step	Action	Value(s)	Yes	No
1	• Perform the On-Board (OBD) System Check? Are any other DTCs present?		Go to Step (3)	Go to Step (2)
2	<ul> <li>Visually and physically check the following items:</li> <li>The air intake duct for being collapsed or restricted</li> <li>The air filter for being plugged</li> <li>System power fuses are good and in the proper location</li> <li>The EGO 1 sensor installed securely and the wire leads not contacting the exhaust manifold or ignition wires</li> <li>ECM grounds must be clean and tight. Refer to Engine Electrical Power and Ground Distribution</li> <li>Fuel System Diagnostics. Refer to Fuel System Diagnostics</li> <li>Was a repair made?</li> </ul>		Go to Step (9)	Go to Step (4)
3	<ul> <li>Diagnose any other DTC codes before proceeding with this chart. Always repair existing codes starting with the lowest numerical code set first.</li> <li>Have any other DTC codes been detected, diagnosed and repaired?</li> </ul>		Go to Step (9)	Go to Step (4)
4	<ul> <li>Disconnect EGO1 connector C005</li> <li>Using a DVOM check for voltage between EGO 1 connector pin B and engine ground</li> <li>Key ON</li> <li>(CHECK MUST BE MADE WITHIN 30 SECONDS OR BEFORE POWER RELAY SHUTS DOWN)</li> <li>Do you have voltage?</li> </ul>	System volt- age	Go to Step (5)	Repair the open EGO power circuit as necessary. 5	<ul> <li>Key OFF</li> <li>Disconnect EGO 1 sensor wire harness connector C005</li> <li>Disconnect ECM wire harness connector C001</li> <li>Key ON</li> <li>Using a high impedance DVOM check for continuity between EGO 1 connector signal pin A and engine ground</li> <li>Do you have continuity?</li> </ul>		Repair the shorted circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (6)

Step	Action	Value(s)	Yes	No
6	<ul> <li>Using a high impedance DVOM check for continuity between EGO 1 connector signal ground pin C and EGO 1 signal pin A</li> <li>Do you have continuity?</li> </ul>		Repair the shorted circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (7)
7	<ul> <li>Using a high impedance DVOM check for continuity between EGO 1 heater ground pin D and ECM pin 49</li> <li>Do you have continuity?</li> </ul>		Go to Step (8)	Repair the open EGO heater ground
8	Replace EGO 1 sensor     Is the replacement complete?		Go to Step (9)	-
9	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1161 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### DTC 172-Adaptive Learn Low (Gasoline) (SPN 4237:FMI 1)

#### **Conditions for Setting the DTC**

- Heated Oxygen Sensor
- Check Condition-Engine running
- Fault Condition-Adaptive multiplier out of range greater than -30%
- MIL-ON

#### **Circuit Description**

The EGO1 sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and Adaptive multiplier. This fault will set if the adaptive multiplier exceeds the limits of normal operation. Always run the fuel system diagnostics before using the following diagnostic chart.

#### **Diagnostic Aid**

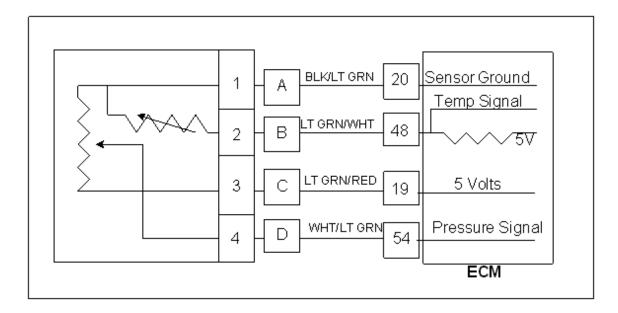

**<u>Fuel System</u>** High fuel pressure will cause the system to run rich. Fuel pressure is controlled by the ECM using a ground side driver. If the fuel pump is turned on all the time the fuel pressure will increase. Open or leaking injector will cause a rich condition.

**Fuel Quality** A drastic variation in fuel quality may cause the fuel system to run rich. **<u>Air Filter</u>** A plugged, damaged or modified air filter may cause the system to run rich.

## DTC 172-Adaptive Learn Low (Gasoline)

Step	Action	Value(s)	Yes	No
1	• Perform the On-Board (OBD) System Check? Are any other DTCs present?		Go to Step (3)	Go to Step (2)
2	<ul> <li>Visually and physically check the following items:</li> <li>The air intake duct for being collapsed or restricted</li> <li>The air filter for being plugged</li> <li>The EGO sensor is installed securely and the wire leads not damaged or contacting the secondary ignition wires</li> <li>ECM grounds for being clean and tight.</li> <li>Fuel system diagnostic checks</li> <li>Was a repair made?</li> </ul>		Go to Step (6)	Go to Step (4)

### DTC 182-Gasoline Fuel Temperature Low (SPN 174:FMI 4)

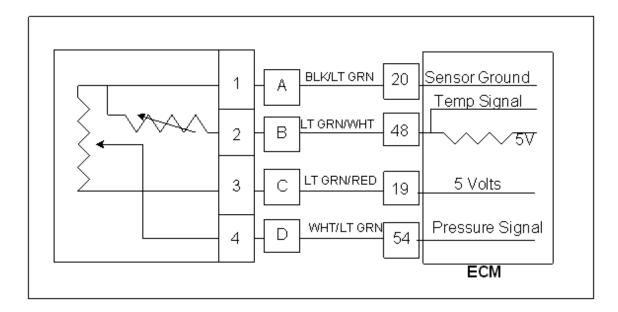

### Conditions for Setting the DTC

- Gasoline fuel temperature low
- Faulty fuel temp sensor
- Fuel temperature sensor voltage lower than .05v for 5 seconds or greater
- Fuel temperature is -35F or less for 5 seconds or greater
- MIL-On for active fault and for 2 seconds after active fault
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

Note: The fuel pressure and temperature sensor is wired via Equipment Manufacturer supplied harness jumper. The terminals A, B, C, D & 19, 20, 48, 54 are engine wiring harness terminals at the fuel sensor interface connector C002 and the ECM header connector C001. You may need to consult additional wiring information supplied by the OEM. The gasoline fuel temperature sensor voltage is read at less than 0.05v. This indicates a low voltage fault from the sensor or circuit. This could also indicate a low fuel temperature reading. Inspect the fuel temperature for extreme cold.

### DTC 183-Gasoline Fuel Temperature High (SPN 174:FMI 3)

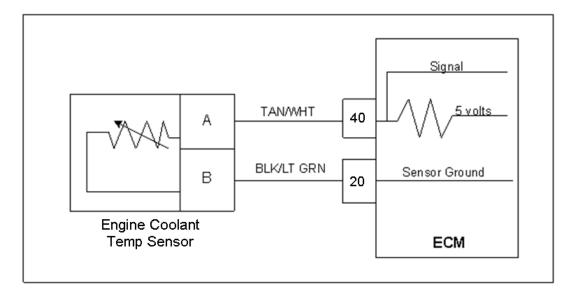

### Conditions for Setting the DTC

- Gasoline fuel temperature high
- Faulty fuel temp sensor
- Fuel temperature sensor voltage greater than 4.95v for 5 seconds or greater
- Fuel temperature is 130F or higher for 5 seconds or greater
- MIL-On for active fault and for 2 seconds after active fault
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

Note: The fuel pressure and temperature sensor is wired via Equipment Manufacturer supplied harness jumper. The terminals A, B, C, D & 19, 20, 48, 54 are engine wiring harness terminals at the fuel sensor interface connector C002 and the ECM header connector C001. You may need to consult additional wiring information supplied by the OEM. The gasoline fuel temperature sensor voltage is read at less than 0.05v. This indicates a high voltage fault from the sensor or circuit. This could also indicate a high fuel temperature reading. Inspect the fuel temperature for extreme hot temperatures.

### DTC 217-ECT Higher Than Expected 2 (SPN 110:FMI 0)

### **Conditions for Setting the DTC**

- Engine Coolant Temperature
- Check Condition-Engine Running
- Fault Condition-Engine Coolant Temperature reading or estimate greater than 250 degrees F. for greater than 5 seconds while engine is above 700 rpms
- MIL-On
- Engine will derate to 1,400 rpms

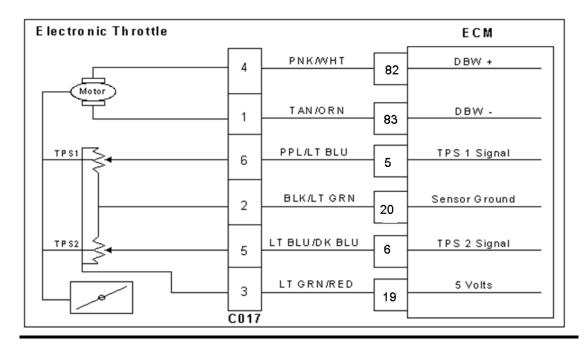

### **Circuit Description**

The ECT (Engine Coolant Temperature) sensor is a temperature sensitive resistor located in the engine coolant sensor that is located in the coolant passage. The ECT is used for engine airflow calculation, fuel enrichment, and ignition timing control and to enable certain other temperature dependant operations. This code set is designed to help prevent engine damage from overheating. The ECM provides a voltage divider circuit so when the sensor reading is cool the sensor reads higher voltage, and lower when warm. This fault will set when the coolant exceeds 250 degrees F. for more than 5 seconds. Engine shutdown will occur if this code occurs.

# DTC 217-ECT Higher Than Expected 2

STEP	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Section
2	<ul> <li>Key ON</li> <li>DST (Diagnostic Scan Tool) connected in system data mode</li> <li>Warm engine to normal operating temperature, then run the engine above</li> <li>1200 rpm for at least 60 seconds</li> <li>Does the DST display ECT temperture of 250 degrees F or greater?</li> </ul>		Go to Step (3)	Intermittent problem Go to Intermittent section
3	Verify with a temperature gauge that the engine coolant is over 250 degrees F. Does the temperature gauge indicated 250 degrees F. or greater?		Repair cooling system.	Go to step (4)
4	Verify ECT Circuit function.		-	-

### DTC 219-Max Govern Speed Override (SPN 515:FMI 15)

#### Conditions for Setting the DTC

- Max Govern Speed Override
- Check Condition-Engine Running
- Fault Condition-Engine rpm greater than 2,850
- Fault condition active for 2 or more seconds
- MIL-ON during active fault

#### **Circuit description**

This fault will set anytime the engine rpm exceeds 2,850 for longer than 2 seconds. The MIL command is ON during this active fault

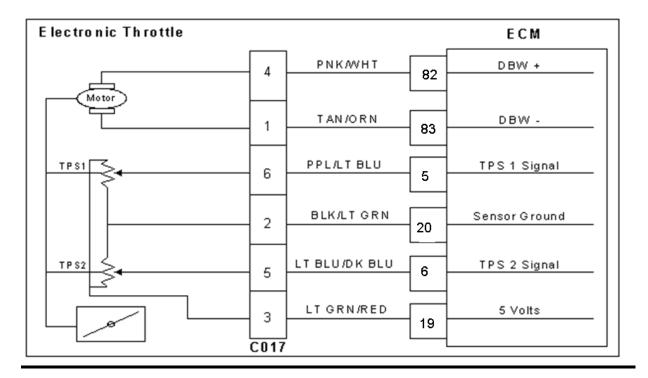

#### **Diagnostic Aid**

Check for other stored DTC codes before using the following DTC chart for this code set. Always diagnose and repair any existing codes starting with the lowest numerical code first.

## DTC 219-Max Govern Speed Override

Step	Action	Value(s)	Yes	Νο
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine OFF</li> <li>DST connected</li> <li>Are any other DTC codes present with DTC 219?</li> </ul>		Go to Step (3)	Go to Step (4)

9	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-219 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### DTC 221-TPS 1 Higher Than TPS 2 (SPN 51:FMI 0)

### Conditions for Setting the DTC

- Throttle Position Sensor 1 & 2
- Check Condition-Key ON
- Fault Condition-TPS 1 20% higher than TPS2
- MIL-ON for remainder of key on cycle
- Engine shutdown

### **Circuit Description**

Dual throttle Position Sensors are used within the throttle that use variable resistors to determine signal voltage based on throttle plate position. TPS 1 will read lower voltage when closed and TPS 2 will read higher voltage when closed. The TPS 1 and TPS 2 percentages are calculated from these voltages. Although the voltages are different, the calculated values for the throttle position percentages should be very close to the same. The TPS values are used by the ECM to determine if the throttle is opening as commanded. The TPS is not serviceable and in the event of a failure the electronic throttle assembly must be replaced. This fault will set if TPS 1 is 20% (or more) higher than TPS 2. At this point the throttle is considered to be out of specification, or there is a problem with the TPS signal circuit. The MIL command is ON and the engine will shutdown.

8	<ul> <li>Inspect the electronic throttle wire harness connector and terminals for damage, corro- sion or contamination</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.	Go to Step (9)
9	Replace electronic throttle Is the replacement complete?		Go to Step (11)	-
10	<ul> <li>Key OFF</li> <li>Disconnect ECM connector C001</li> <li>Using a DVOM check for continuity between throttle connector C017 sensor ground pin 2 and ECM connector sensor ground pin 20 Do have continuity between them?</li> </ul>		Go to Step (6)	Repair the cir- cuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.

Step	Action	Value(s)	Yes	Νο
	Connect any disconnected components, fuses, etc. Using the DST clear DTC information from the ECM. Turn the ignition OFF and wait 30 seconds. Start the engine and operate the vehicle to full operating temperature Observe the MIL Observe engine performance and drivability		System OK	Go to OBD System Check

### DTC 261: Injector driver 1 (cyl 1) open or short to ground SPN 651:FMI 5

### Conditions for Setting the DTC

- Injector is in the Off State
- Low side voltage is less than 4.0 volts
- Battery voltage is above 9.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a low voltage on the low side during an "injector off" state. This indicates the injector is open or there is a short to ground in the circuit.

The technician should check the wiring and the injector resistance. If the resistance is out of specification or you get an infinite reading on the DVOM you should replace the injector. If there is a short to ground in the wiring circuit you should repair the faulty circuit in accordance with the recommended wire repair instructions provided in this manual.

Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a low voltage on the low side during an "injector off" state. This indicates the injector is open or there is a short to ground in the circuit.

The technician should check the wiring and the injector resistance. If the resistance is out of specification or you get an infinite reading on the DVOM you should replace the injector. If there is a short to ground in the wiring circuit you should repair the faulty circuit in accordance with the recommended wire repair instructions provided in this manual.

### DTC 276: Injector driver 6 (Cyl 2) open or short to ground

### SPN 656:FMI 5

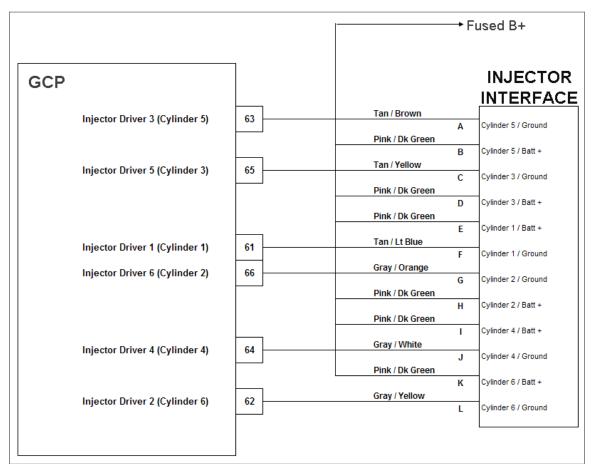

#### **Conditions for Setting the DTC**

- Injector is in the Off State
- Low side voltage is less than 4.0 volts
- Battery voltage is above 9.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a low voltage on the low side during an "injector off" state. This indicates the injector is open or there is a short to ground in the circuit.

## DTC 262: Injector driver 1 (Cyl 1) Coil Shorted (SPN 651:FMI 6)

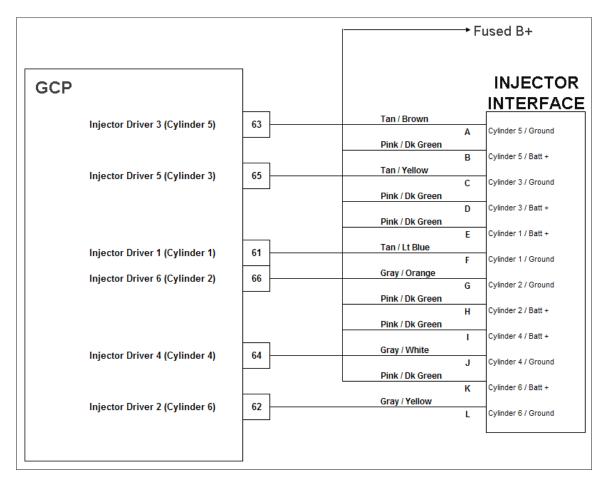

#### Conditions for Setting the DTC

- Injector is in the On State
- Low side voltage is greater than 4.0 volts
- Battery voltage is less than 16.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a high voltage on the low side during an "injector on" state. This indicates the injector likely has a short circuit internal to the injector. It could also be a result of a short from power to the ground circuit.

### DTC 265: Injector driver 2 (Cyl 6) Coil Shorted (SPN:652:FMI 6)

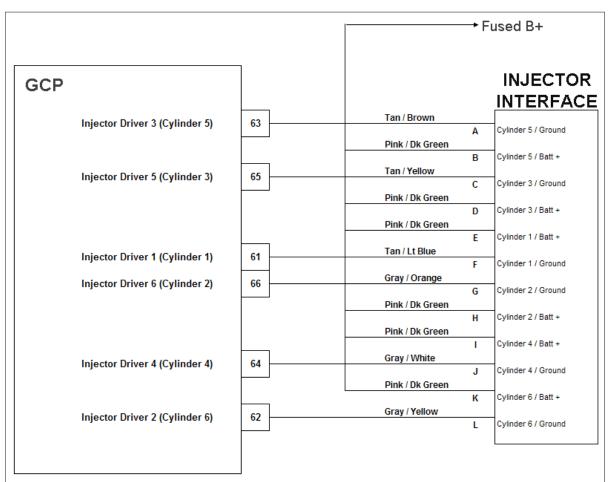

#### Conditions for Setting the DTC

- Injector is in the On State
- Low side voltage is greater than 4.0 volts
- Battery voltage is less than 16.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a high voltage on the low side during an "injector on" state. This indicates the injector likely has a short circuit internal to the injector. It could also be a result of a short from power to the ground circuit.

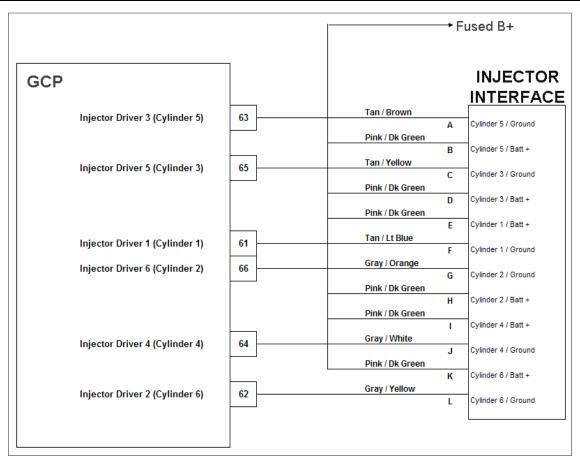

## DTC 268: Injector driver 3 (Cyl 5) Coil Shorted (SPN 653:FMI 6)

#### Conditions for Setting the DTC

- Injector is in the On State
- Low side voltage is greater than 4.0 volts
- Battery voltage is less than 16.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a high voltage on the low side during an "injector on" state. This indicates the injector likely has a short circuit internal to the injector. It could also be a result of a short from power to the ground circuit.

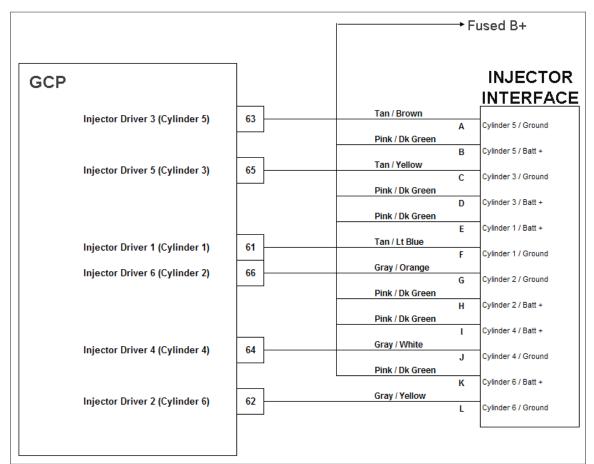

### DTC 271: Injector driver 4 (Cyl 4) Coil Shorted (SPN 654:FMI 6)

#### **Conditions for Setting the DTC**

- Injector is in the On State
- Low side voltage is greater than 4.0 volts
- Battery voltage is less than 16.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a high voltage on the low side during an "injector on" state. This indicates the injector likely has a short circuit internal to the injector. It could also be a result of a short from power to the ground circuit.

## DTC 274: Injector driver 5 (Cyl 3) Coil Shorted (SPN 655: FMI 6)

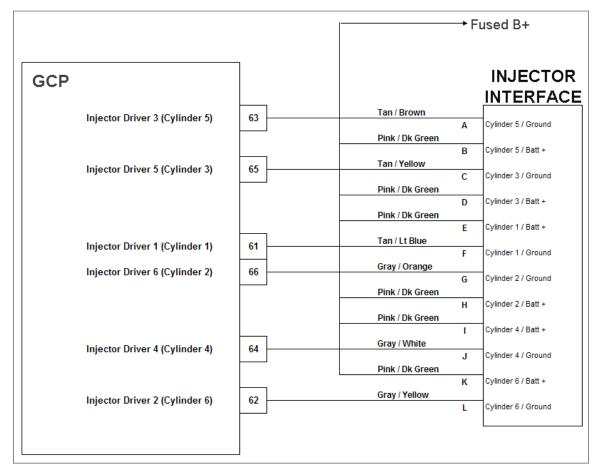

#### **Conditions for Setting the DTC**

- Injector is in the On State
- Low side voltage is greater than 4.0 volts
- Battery voltage is less than 16.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a high voltage on the low side during an "injector on" state. This indicates the injector likely has a short circuit internal to the injector. It could also be a result of a short from power to the ground circuit.

## DTC 277: Injector driver 6 (Cyl 2) Coil Shorted (SPN 656:FMI 6)

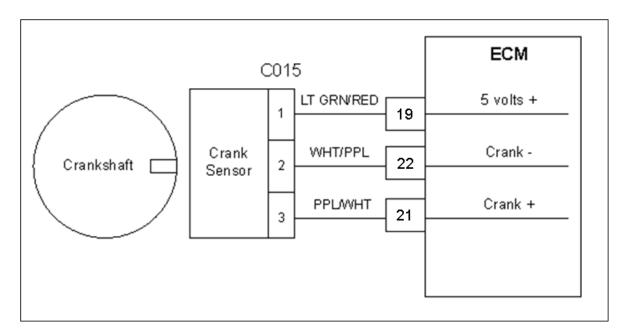

#### **Conditions for Setting the DTC**

- Injector is in the On State
- Low side voltage is greater than 4.0 volts
- Battery voltage is less than 16.0 volts
- MIL Light turned on
- Closed Loop is disabled while this fault is active
- Adaptive Learn is disabled while this fault is active.

#### **Circuit Description**

The fuel injectors turn on when the ECM provides a ground circuit to the injector. Battery positive is constantly provided through the ignition fuse and the Pink / DK Green wire. Each Injector has a ground side driver assigned to it inside the ECM. The driver number does not match up with the mating cylinder number in each case. The driver is assigned in numerical order according to the engine firing order (4.3L = 1, 6, 5, 4, 3, 2). The ECM is monitoring the low side voltage internally in the ECM. This code will set if it sees a high voltage on the low side during an "injector on" state. This indicates the injector likely has a short circuit internal to the injector. It could also be a result of a short from power to the ground circuit.

### DTC 336-Crank Sync Noise (SPN 636:FMI 2)

#### Conditions for setting the DTC

- Crankshaft Position sensor
- Check Condition- Engine running
- Fault Condition- 1 invalid crank re-sync in less than 800 ms
- Adaptive- Disabled
- MIL- On during active fault

#### **Circuit Description**

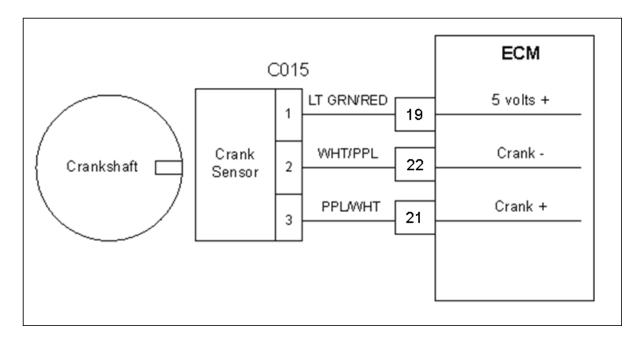

The Crankshaft position sensor is a 5 volt powered sensor mounted to the lower front engine block. A pulse wheel located on the crankshaft is used to measure engine rpm and its signal is used to synchronize the ignition and fuel systems. This fault will set If no signal is present for 800ms or longer.

## DTC 336 Crank Sync Noise

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Check that the ECM ground terminals C010, C022 and C023 are clean and tight Are the ground terminals clean and tight?</li> </ul>		Go to Step (3)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
3	<ul> <li>Key On, Engine OFF</li> <li>Disconnect the CKP (Crankshaft position) Sensor connector C015</li> <li>Using A DVOM check for voltage at the CKP sensor connector pin 1 and engine ground</li> <li>(CHECK THIS BEFORE THE POWER RELAY SHUTS OFF)</li> <li>Do you have voltage?</li> </ul>	5.0 volts	Go to Step (4	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	<ul> <li>Key OFF</li> <li>Disconnect ECM connector C001</li> <li>Using a DVOM check for continuity between CKP connector pin 2 and ECM connector pin 22</li> <li>Do you have continuity between them?</li> </ul>		Go to Step (5)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
5	<ul> <li>Using a DVOM check for continuity between CKP connector pin 3 and ECM connector pin 21</li> <li>Do you have continuity between them?</li> </ul>		Go to Step (6)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
6	<ul> <li>Inspect the CKP connector C015 terminals for damage, corrosion or contamination</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.	Go to Step (7)
7	<ul> <li>Inspect the ECM connector C001 terminals 19, 22, and 21 for damage, corrosion or con- tamination</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.	Go to step (8)

Step	Action	Value(s)	Yes	No
8	Replace CKP sensor     Is the replacement complete?		Go to Step (10)	-
9	Replace ECM Is the replacement complete?		Go to Step (11)	-
10	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-336 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to Step (9)
11	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-336 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 337-Crank Loss (SPN 636:FMI 4)

#### Conditions for setting the DTC

- Crankshaft position sensor
- Check Condition- Engine cranking
- Fault Condition- 6 cam pulse signals without crankshaft activity
- MIL- On during active fault
- Adaptive- Disabled

#### **Circuit Description**

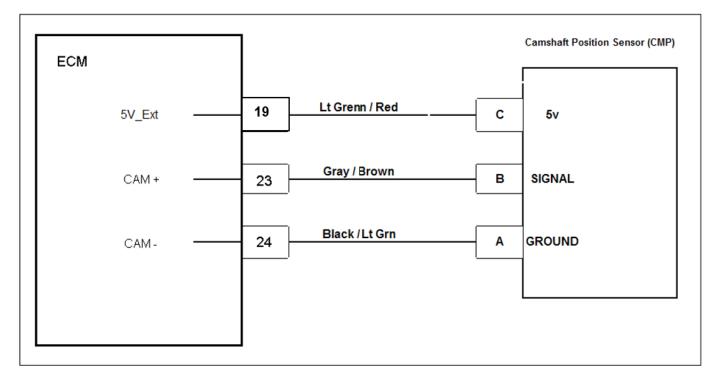

The Crankshaft position sensor is a 5 volt powered sensor mounted to the lower front engine block. A pulse wheel located on the crankshaft is used to measure engine rpm and its signal is used to synchronize the ignition and fuel systems. The ECM must see a valid Crankshaft position signal while cranking. If no crankshaft signal is present for 6 cam pulses this fault will set.

# DTC 337-Crank Loss

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Check that the ECM ground terminals C010, C022 and C023 are clean and tight</li> <li>Are the ground terminals clean and tight?</li> </ul>		Go to Step (3)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.

### DTC 342-Camshaft Sensor Loss (SPN 723:FMI 4)

#### **Conditions for Setting the DTC**

- CMP (Camshaft Position Sensor)
- Check Condition-Engine Cranking or Running
- Fault Condition-No cam pulse in 2.5 cycles with engine speed greater than 100 rpm
- MIL-ON for active fault
- Adaptive-Disabled

#### **Circuit Description**

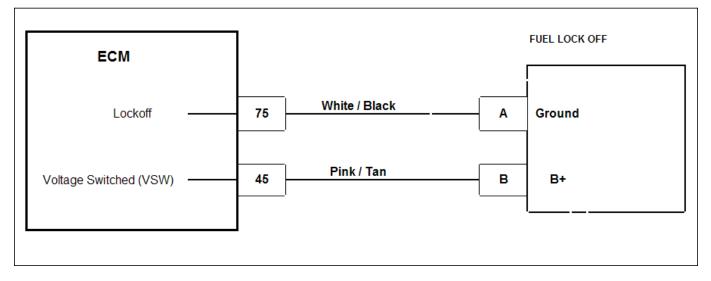

The CMP (Camshaft Position Sensor) is used to synchronize the fuel and ignition systems. This fault will set if the ECM does not detect a cam pulse in 2.5 engine cycles whenever the engine is greater than 100 rpm. The engine may not run with this fault present.

### DTC-359 Fuel Run-out Longer Than Expected (SPN 632:FMI 31)

#### **Conditions for Setting the DTC**

- LPG lock-off valve
- Check Condition-Key OFF
- Fault Condition-Engine run down time greater than 20 seconds
- MIL-ON

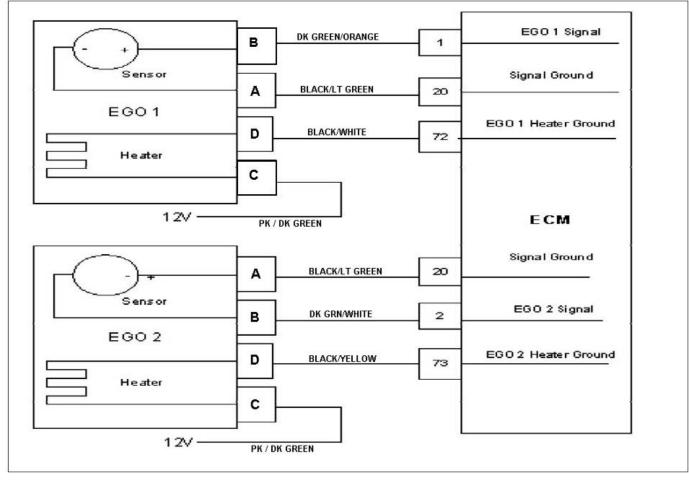

#### **Circuit Description**

The LPG lock off valve is supplied system battery power from the VSW fused source. The ECM then provides a path to ground to turn the valve on. This fault will set in the event the engine continues to run for more than 20 seconds after the key is turned off. This fault indicates a possible problem with the electric LPG lock off solenoid.

# DTC-359 Fuel Run-out Longer Than Expected

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	
2	<ul> <li>Disconnect the LPG shut off solenoid connector C003</li> <li>Using a DVOM check for power across terminals A and B while cranking the engine, then turn the key to the OFF position</li> <li>Did the voltage immediately turn OFF with the key cycle?</li> </ul>	System Volt- age	Go to Step (3)	Go to Step (5)
3	<ul> <li>Turn off the LPG manual valve at the fuel tank</li> <li>Start the engine and let it idle until the engine stops.</li> <li>(THIS MAY TAKE SEVERAL MINUTES)</li> <li>Did the engine ever stop?</li> </ul>		Intermittent problem. See intermittent problems in the electrical section of this manual.	Go to Step (4)
4	Replace the LPG shut off solenoid Is the replacement complete?		Go to Step (8)	_
5	<ul> <li>Key OFF</li> <li>Disconnect the ECM wire harness connector C001</li> <li>Using a DVOM check for continuity between ECM pin 12 and engine ground</li> <li>Do you have continuity?</li> </ul>		Repair the LPG solenoid control short to ground	Go to Step (6)
6	<ul> <li>Inspect the ECM wire harness and con- nector for damage corrosion or contamination</li> <li>Did you find a problem?</li> </ul>		Correct the problem as required. See wire harness repair.	Go to Step (7)

8	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-359 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 420 Gasoline Catalyst Monitor (SPN 3050:FMI 11)

### **Conditions for Setting the DTC**

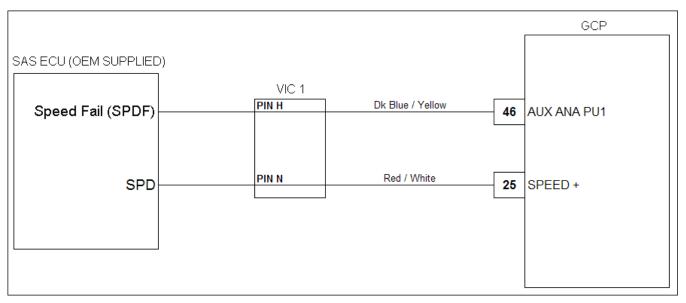

- Catalyst Function
- Check condition- Engine running
- Fault condition- EGO 1 signal = EGO 2 signal for 100 updates
- MIL- On during active fault and for 1 second after active fault
- Adaptive- Disabled during active fault

#### **Circuit Description**

The ECM uses EGO 1 and EGO 2 sensor signals to diagnose problems with the catalyst muffler. When the signals for EGO 1 & EGO 2 are similar it may indicate a problem with the catalyst.

#### **Diagnostic Aids**

Always diagnose any other troubles, stored along with DTC 420 first. Check for and eliminate any exhaust leaks prior to replacing catalyst muffler. Look for exhaust leaks at the catalyst muffler inlet and tail pipes. Clear this trouble code after repairing exhaust leaks, and recheck for code. If there are no exhaust leaks or other exhaust related issues there may be a problem internally with the catalyst muffler.

### DTC 502 – Loss of Road Speed (SPN 84:FMI 8)

### Conditions for setting the DTC

- Road speed input is less than 0.1 km/hr
- Fault must be active for 5.0 seconds to activate DTC
- Engine speed is greater than 1,500 rpms
- MAP pressure is greater than 10.00 PSIA
- SPDF signal indicates vehicle is moving
- MIL light on during fault
- Power Derate 2 enabled

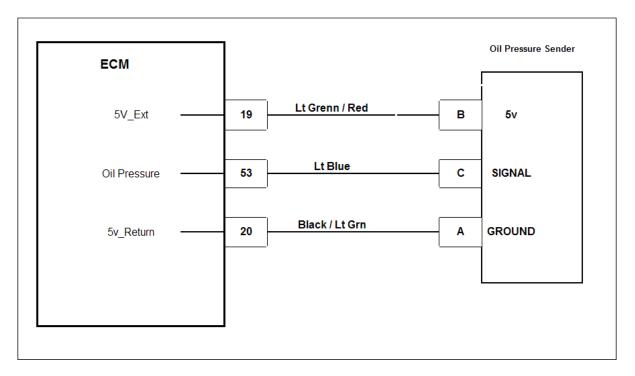

#### **Circuit Description**

The ECM is provided a pulse width modulation (PWM) signal from the OEM vehicle controller to determine the road speed of the vehicle. The PWM signal is supplied to the engine VIC1 Pin N and finally to pin 25 at the ECM connector. The DTC will set when the PWM signal is lost and the engine speed is greater than 1,500 rpms, MAP pressure is greater than 10.0 psia and the SPDF signal indicates the vehicle is moving. The technician should check the OEM system including vehicle speed controller along with circuit between the vehicle speed controller and the engine ECM.

# DTC 502 – Loss of Road Speed

STEP	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Section
2	<ul> <li>Key Off</li> <li>Check the wiring for continuity between terminals 25 at the GCP Connector and Pin N of the VIC 1</li> <li>Do you have continuity between the terminals?</li> </ul>	No Resistance	Go to Step (3)	Repair wire circuit between Pin N and Pin 25.
3	Check Pin N and Pin 25 for spread terminals or poor connections with the mating terminals.  Are the pins acceptable for use?	-	Go to Step (4)	Repair damaged terminal
4	<ul> <li>Key off</li> <li>Disconnect battery</li> <li>Install Test GCP</li> <li>Reconnect battery</li> <li>Start engine and check for fault</li> </ul>	-	Replace GCP Module	Refer to OEM wiring and/or speed detection system

## DTC 520-Oil Pressure Low Stage 1 (SPN 100:FMI 18)

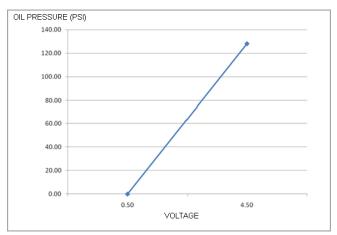

### Conditions for Setting the DTC

- Engine Oil Pressure low.
- Engine running with engine speed less than 1200 rpm and oil pressure is less than 15 psi for 5 or more seconds
- Engine running with engine speed greater than 1450 rpm and oil pressure is less than 20 psi for 5 or more seconds
- MIL is active

#### **Circuit Description**

The Oil Pressure Sender is used to communicate the oil pressure condition to the ECM. Engine damage can occur if the engine is operated with low oil pressure. The ECM sends a 5v signal to the oil pressure sender. The sender will report a signal back to the ECM on the signal wire depending on the pressure that is applied on its diaphragm. The voltage is linear in comparison to the pressure applied (see chart below). The MIL command is ON.

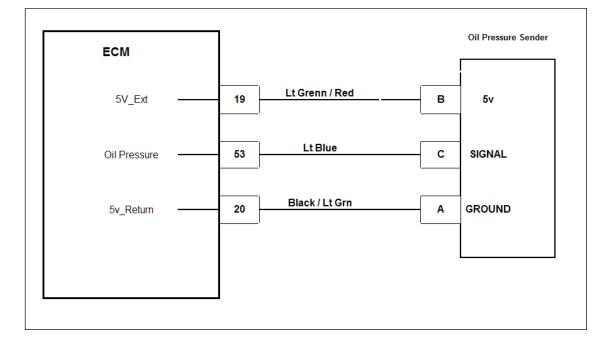

# DTC 520-Oil Pressure Low Stage 1

### DTC 521- Oil Pressure High (SPN 100:FMI 0)

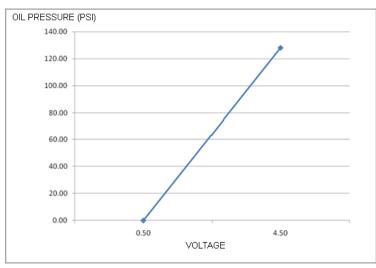

#### **Conditions for Setting the DTC**

- Engine Oil Pressure high.
- Check Condition-Engine running for 5 seconds.
- Fault Condition- Oil pressure greater than 95 psi for 5 or more seconds
- Forced idle is active

#### **Circuit Description**

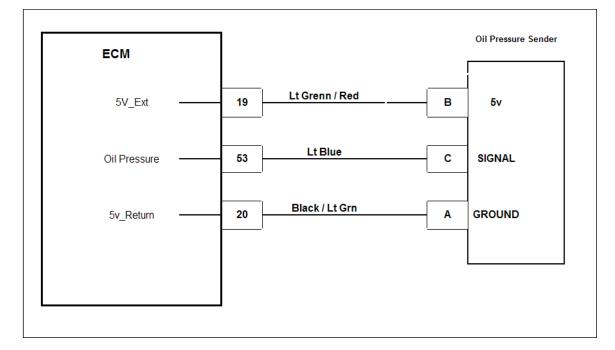

The Oil Pressure Sender is used to communicate the oil pressure condition to the ECM. Engine damage can occur if the engine is operated with low oil pressure. The ECM sends a 5v signal to the oil pressure sender. The sender will report a signal back to the ECM on the signal wire depending on the pressure that is applied on its diaphragm. The voltage is linear in comparison to the pressure applied (see chart below). The MIL command is ON and the engine will go into a forced idle condition in the event of this fault to help prevent possible engine damage.

# DTC 521-Oil Pressure High

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Verify that the engine has oil pressure using a mechanical oil pressure gauge before pro- ceeding with this chart. See Engine Specifications Section 1F.</li> <li>Does the engine have oil pressure above 95 psi?</li> </ul>		Repair faulty oiling system	Go to step (3)
3	<ul> <li>With the engine running measure the signal voltage on terminal C of the oil pressure sender.</li> <li>Do you have more than 3.8v?</li> </ul>	> 3.8v.	Replace faulty oil pres- sure sender.	Go to step (4)
4	<ul> <li>With the engine running measure the signal voltage on terminal 53 of the ECM.</li> <li>Do you have more than 3.8v?</li> </ul>	> 3.8v.	Repair faulty wiring be- tween terminal C and 25.	Replace faulty IEPR / ECM

### DTC 522- Oil Pressure Sender low voltage (SPN 100:FMI 4)

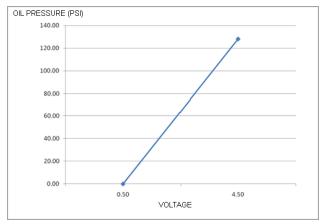

#### **Conditions for Setting the DTC**

- Engine Oil Pressure low.
- Check Condition-Engine running for 20 seconds or more with engine speed greater than 600 rpm.
- Fault Condition- Voltage on terminal 25 is less than 0.2v for more than 1 second
- MIL-ON during active fault and for 2 seconds after active fault.
- Forced idle active

#### **Circuit Description**

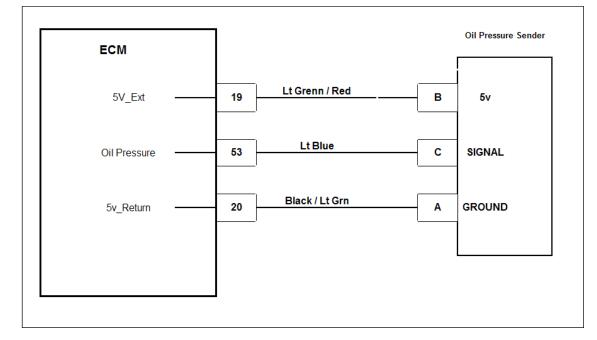

The Oil Pressure Sender is used to communicate the oil pressure condition to the ECM. Engine damage can occur if the engine is operated with low oil pressure. The ECM sends a 5v signal to the oil pressure sender. The sender will report a signal back to the ECM on the signal wire depending on the pressure that is applied on its diaphragm. The voltage is linear in comparison to the pressure applied (see chart below). The MIL command is ON and the engine will go into a forced idle in the event of this fault to help prevent possible engine damage.

Intermittent problem, go to intermittent section
6	<ul> <li>Key on</li> <li>Check for voltage supply signal at terminal 19 of the ECM</li> <li>Does the ECM terminal 19 provide a 5v signal?</li> </ul>	5v	Replace ECM.	Repair wiring issue be- tween pin 19 and oil pres- sure sender terminal B

### DTC 523- Oil Pressure Sender high voltage (SPN 100:FMI 3)

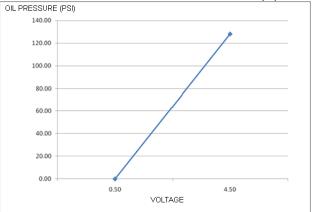

#### **Conditions for Setting the DTC**

- Engine Oil Pressure sender voltage is high
- Check Condition-Engine running for 20 seconds or more with engine speed greater than 600 rpm.
- Fault Condition- Voltage on terminal 25 is greater than 4.8v for more than 1 second
- MIL-ON during active fault and for 2 seconds after active fault.
- Forced idle active

#### **Circuit Description**

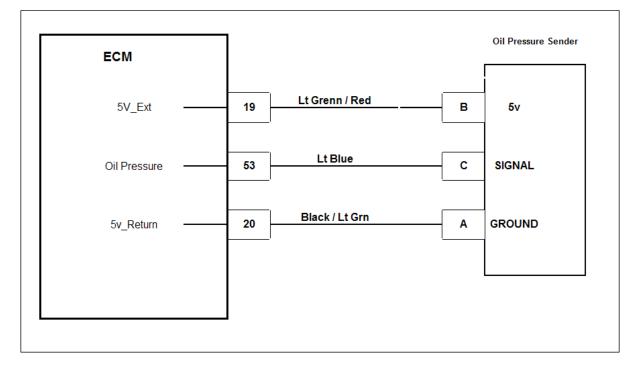

The Oil Pressure Sender is used to communicate the oil pressure condition to the ECM. Engine damage can occur if the engine is operated with low oil pressure. The ECM sends a 5v signal to the oil pressure sender. The sender will report a signal back to the ECM on the signal wire depending on the pressure that is applied on its diaphragm. The voltage is linear in comparison to the pressure applied (see chart below). The MIL command is ON and the engine will go into forced idle in the event of this fault to help prevent possible engine damage.

1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Using the Diagnostic Service Tool (DST) check the OILP_raw value on the "RAW VOLTS" page.</li> <li>Is the voltage over 4.8 volts</li> </ul>	> 4.8v	Go to Step (3)	Check for faulty harness or intermittent ECM issue
3	<ul> <li>Using a voltmeter measure the voltage at terminal 53 of the ECM</li> <li>Is the voltage over 4.8 volts?</li> </ul>	> 4.8v	Go to Step (4)	Replace faulty IEPR / ECM
4	<ul> <li>Using a voltmeter measure the voltage at terminal C at the oil pressure sender.</li> <li>Is the voltage over 4.8 volts?</li> </ul>	> 4.8v	Replace faulty oil pres- sure sender.	Intermittent problem, go to intermittent section

## DTC 524-Oil Pressure Low Stage 2 (SPN 100:FMI 1)

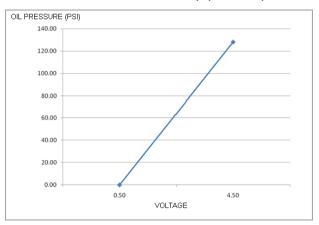

#### **Conditions for Setting the DTC**

- Engine Oil Pressure low.
- Fault Condition- Oil pressure less than 8 psi for 5 or more seconds
- Engine Shut Down.

#### **Circuit Description**

The Oil Pressure Sender is used to communicate the oil pressure condition to the ECM. Engine damage can occur if the engine is operated with low oil pressure. The ECM sends a 5v signal to the oil pressure sender. The sender will report a signal back to the ECM on the signal wire depending on the pressure that is applied on its diaphragm. The voltage is linear in comparison to the pressure applied (see chart below). The MIL command is ON and the engine will shut down in the event of this fault to help prevent possible engine damage.

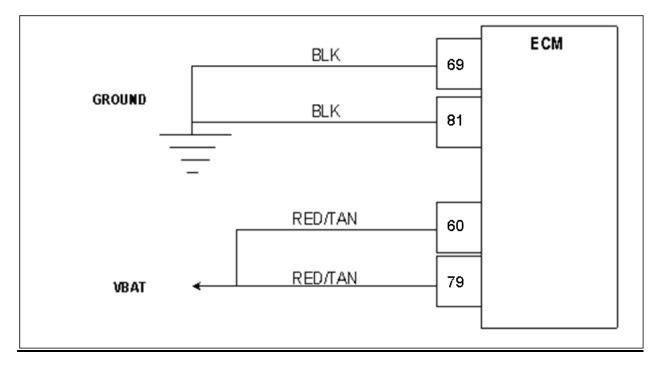

## DTC 524-Oil Pressure Low

9	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-524 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 562-System Voltage Low (SPN 168:FMI 17)

### Conditions for Setting the DTC

- System Voltage to ECM
- Check Condition-Key on with engine speed greater than 1000 RPM
- Fault Condition-Battery voltage at ECM less than 9.0
- Fault Condition is present for longer than 5 seconds.
- MIL-ON for active fault
- Adaptive-Disabled

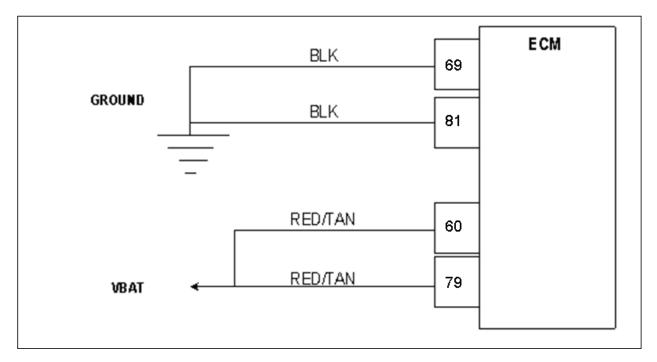

#### **Circuit Description**

The battery voltage powers the ECM and must be measured to correctly to properly operate injector drivers, solenoid valves and ignition coils. This fault will set if the ECM detects system voltage less than 9.00 volts while the alternator should be charging. The adaptive learn is disabled during this fault.

# DTC 562-System Voltage Low

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Does DST display system voltage greater than 9.50 volts?</li> </ul>	-	Intermittent problem Go to Engine Electrical In- termittent section	Go to Step (3)

8	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-562 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>	-	System OK	Go to OBD System Check

## DTC 563-System Voltage High (SPN 168:FMI 15)

### **Conditions for Setting the DTC**

- System Voltage to ECM
- Check Condition-Cranking or Running
- Fault Condition-System battery voltage at ECM greater than 18 volts
- Fault must be present for 3 or more seconds
- MIL-ON for active fault
- Adaptive-Disabled

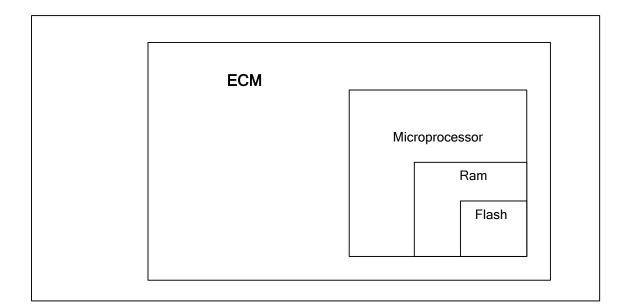

### **Circuit Description**

The battery voltage powers the ECM and must be measured to correctly operate injector drivers, trim valves and ignition coils. This fault will set if the ECM detects voltage greater than 18 volts anytime the engine is cranking or running. The adaptive learn function is disabled during this fault. The ECM will shut down with internal protection if the system voltage ever exceeds 26 volts.

# DTC 563-System Voltage High

6	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-563 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 601-Flash Checksum Invalid (SPN 628:FMI 13)

## **Conditions for Setting the DTC**

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Engine Shutdown will occur

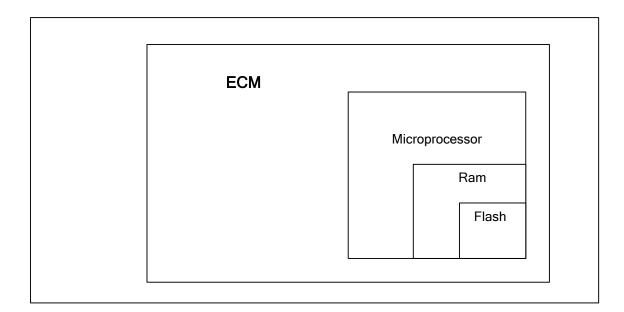

## **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST. The engine will shut down when this fault occurs.

# DTC 601-Flash Checksum Invalid

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC 601 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	• Check ECM power and ground circuits Did the power and ground circuits check OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	Replace ECM Is the replacement complete?		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-601 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 604-RAM Failure (SPN 630:FMI 12)

### **Conditions for Setting the DTC**

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Engine Shutdown will occur

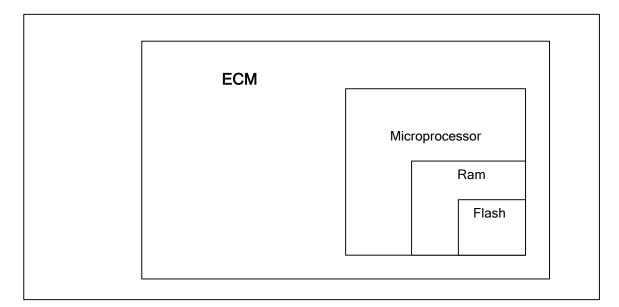

### **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST. The engine will shut down if this fault occurs.

3	Check ECM power and ground circuits Did the power and ground circuits check OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	Replace ECM Is the replacement complete?		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-604 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 606-COP Failure (SPN 629:FMI 31)

### **Conditions for Setting the DTC**

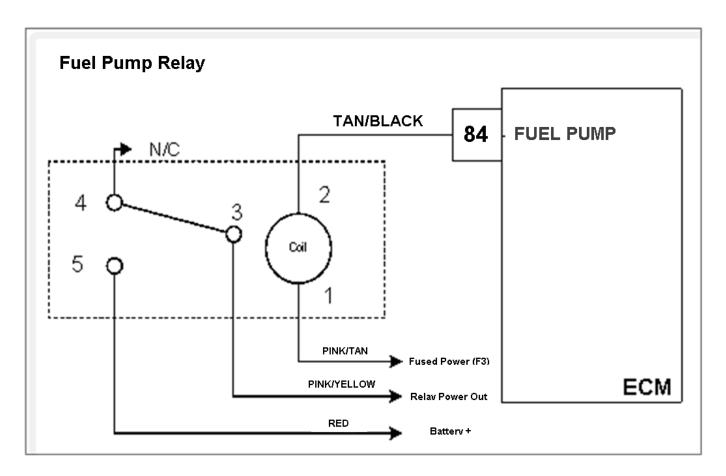

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Engine Shutdown will occur

### **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST. The engine will shut down if this fault occurs.

# DTC 606-COP Failure

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC 606 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	Check ECM power and ground circuits     Are the power and ground circuits OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	Replace ECM Is the replacement complete?		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-606 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### **Conditions for Setting the DTC**

- Fuel Pump relay check
- Check Condition-Key ON
- Fault Condition-Relay coil open

### **Circuit Description**

The fuel pump relay switches power out to the gasoline fuel pump. This fault will set if the ECM detects an open circuit on the relay control output.

#### **Diagnostic Aid**

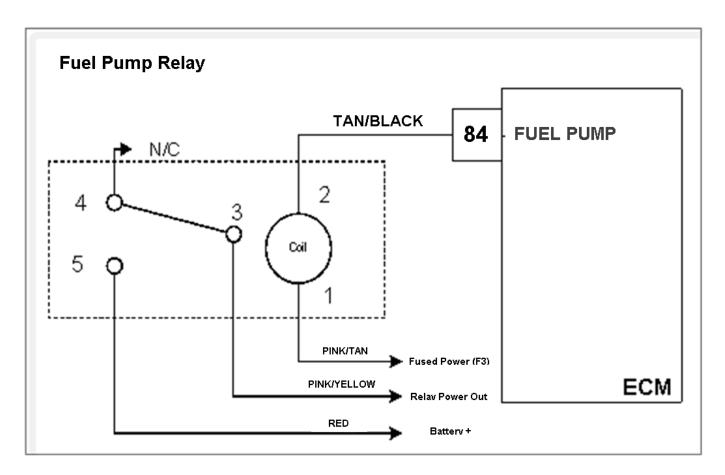

Relay coil resistance changes with temperature. The following diagnostic charts have steps to measure relay coil resistance values. When checking the resistance values be sure the relay is at a reasonable temperature, between +20 and +100 degrees F.

### DTC 642-External 5 Volt 1 Reference Low (SPN 1079:FMI 4)

### Conditions for Setting the DTC

- External 5 volt reference
- Check Condition-Engine cranking or running
- Fault Condition-5 volt reference voltage lower than 4.60 volts
- MIL-ON during active fault
- Adaptive-Disabled during active fault

#### **Circuit Description**

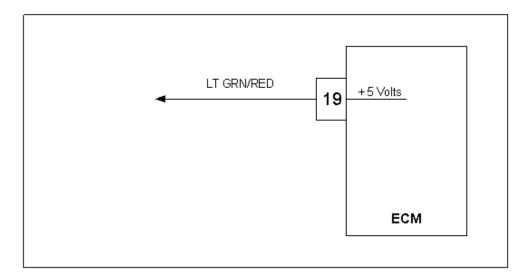

The External 5 volt supply powers many of the sensors and other components of the fuel system. The accuracy of the 5 volt supply is very important to the accuracy of the powered sensors and fuel control by the ECM. The ECM is able to determine if they are overloaded, shorted, or otherwise out of specification by monitoring the 5 volt supply. This fault will set if the 5 volt reference is below 4.60 volts. Adaptive Learn will be disabled during this fault

# DTC 642 External 5 Volt 1 Reference Low

	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-642 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 643-External 5 Volt 1 Reference High (SPN 1079:FMI 3)

### Conditions for Setting the DTC

- External 5 volt reference
- Check Condition-Engine cranking or running
- Fault Condition-5 volt reference higher than 5.40 volts
- MIL-ON during active fault
- Adaptive-Disabled during active fault

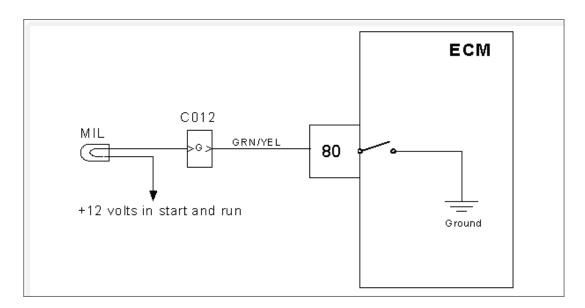

### **Circuit Description**

The External 5 volt supply powers many of the sensors and other components in the fuel system. The accuracy of the 5 volt supply is very important to the accuracy of the powered sensors and fuel control by the ECM. The ECM is able to determine if they are overloaded, shorted, or otherwise out of specification by monitoring the 5volt supply. This fault will set if the 5 volt reference is greater than 5.40 volts anytime the engine is cranking or running. Adaptive Learn will be disabled during this fault

5	Replace ECM Is the replacement complete?		Go to Step (6)	-
6	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-643 check for any stored codes.</li> <li>Does the vehicle engine normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 650-MIL Control Open (SPN:1213:FMI 5)

### Conditions for setting the DTC

- MIL check
- Check Condition-Key ON engine OFF
- Fault Condition-ECM MIL circuit open
- MIL Command-ON

### **Circuit Description**

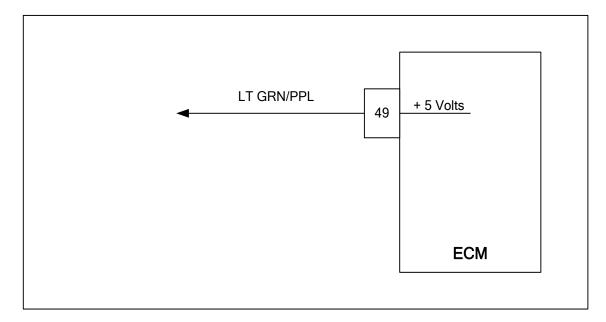

The fuel system is equipped with OBD (On-Board Diagnostics). The system has a dash mounted MIL (Malfunction Indicator Lamp). The MIL serves as notification of an emissions related problem. The MIL also has the ability to flash DTC codes in what is referred to as the blink code mode. It will display DTCs that have been stored due to a possible system malfunction. The following DTC charts in this manual will instruct the technician to perform the OBD system check. This simply means to verify the operation of the MIL. The lamp should illuminate when the key is in the ON position, and the engine is not running. This feature verifies that the lamp is in proper working order. If the lamp does not illuminate with the vehicle key ON and engine OFF, repair it as soon as possible. Once the engine is in start or run mode, the lamp should go off. If the lamp stays on while the engine is in the MIL electrical wiring. The electrical schematic above shows the MIL power source supplied to the lamp. The ECM completes the circuit to ground to turn the lamp ON. This fault will set if the ECM MIL control circuit is open.

# DTC 650-MIL Control Open

## DTC 652-External 5 Volt 2 Reference Low (SPN 1080:FMI 4)

### Conditions for Setting the DTC

- External 5 volt reference
- Check Condition-Engine cranking or running
- Fault Condition-5 volt reference voltage lower than 3.00 volts
- MIL-On during active fault
- Adaptive-Disabled during active fault

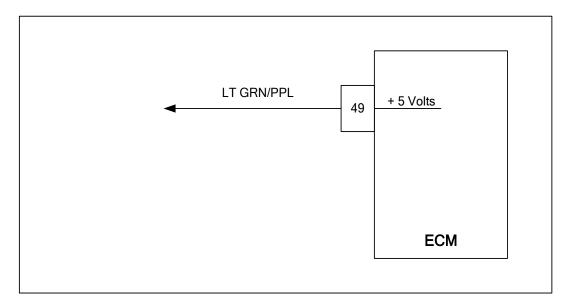

#### **Circuit Description**

The External 5 volt supply is normally dedicated to the FPP sensor 5 volt supply circuit. The accuracy of the 5 volt supply is very important to the accuracy of the FPP sensor circuit. The ECM is able to determine if the circuit is open, shorted, or otherwise out of specification by monitoring this 5 volt supply. This fault will set if the 5 volt reference is below 3.00 volts. Adaptive Learn will be disabled during this fault.

## DTC 653-External 5 Volt 2 Reference High (SPN 1080:FMI 3)

### Conditions for Setting the DTC

- External 5 volt reference
- Check Condition-Engine cranking or running
- Fault Condition-5 volt reference higher than 5.40 volts
- MIL-On during active fault
- Adaptive-Disabled during active fault

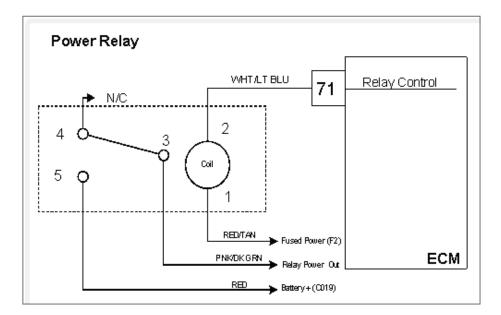

### **Circuit Description**

The External 5 volt supply is normally dedicated to the FPP sensor 5 volt supply circuit. The accuracy of the 5 volt supply is very important to the accuracy of the FPP sensor circuit. The ECM is able to determine if the circuit is open, shorted, or otherwise out of specification by monitoring this 5 volt supply. This fault will set if the 5 volt reference is above 5.40 volts. Adaptive Learn will be disabled during this fault.

## DTC 685-Relay Coil Open (SPN 1485:FMI 5)

### Conditions for Setting the DTC

- Power relay check
- Check Condition-Key ON
- Fault Condition-Relay coil open

### **Circuit Description**

The power relay switches power out to various sensors, actuators and solenoids in the fuel system. This fault will set if the ECM detects an open circuit on the relay control output.

#### **Diagnostic Aid**

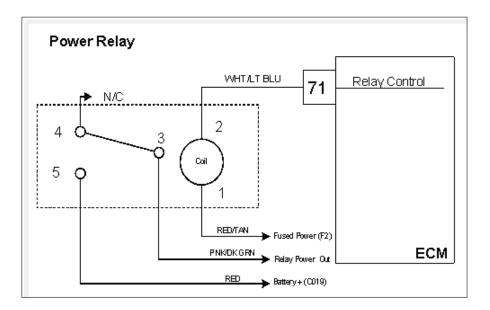

Relay coil resistance changes with temperature. The following diagnostic charts have steps to measure relay coil resistance values. When checking the resistance values be sure the relay is at a reasonable temperature, between +20 and +100 degrees F.

# DTC 685-Relay Coil Open

# DTC 686-Relay Control Ground Short (SPN 1485:FMI 4)

#### Conditions for Setting the DTC

- Power relay ground control
- Check Condition-Key ON
- Fault Condition-Relay control shorted to ground

### **Circuit Description**

The power relay switches power out to various sensors, actuators and solenoids in the fuel system. This fault will set if the ECM detects a short to ground on the relay control output.

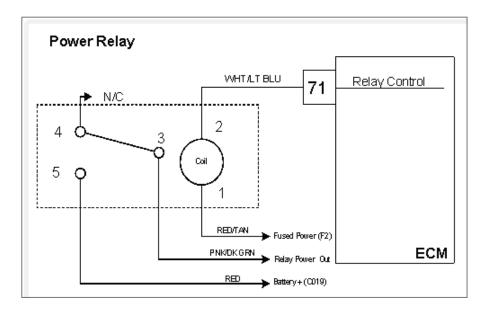

#### **Diagnostic Aid**

Relay coil resistance changes with temperature. The following diagnostic charts have steps to measure relay coil resistance values. When checking the resistance values be sure the relay is at a reasonable temperature, between +20 and +100 degrees F.

# DTC 686-Relay Control Ground Short

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, DST connected in the System Data mode</li> <li>Clear DTC 686</li> <li>Start the engine Does DTC 686 re-set?</li> </ul>		Go to Step (4)	Intermittent problem Go to Inter- mittent section
3	<ul> <li>Disconnect ECM connector C001</li> <li>Using a DVOM check the resistance value between ECM pin 71 and engine ground</li> <li>Is the resistance less than 60 ohms?</li> </ul>		Go to Step (5)	Go to Step (7)
4	<ul> <li>Remove the power relay from the fuse block</li> <li>Using a DVOM check the resistance value again between ECM pin 71 and engine ground</li> <li>Is the resistance less than 60 ohms?</li> </ul>		Repair the shorted to ground relay control circuit as necessary. See wiring harness re- pairs	Go to Step (6)
5	<ul> <li>Replace the power relay</li> <li>Is the replacement complete?</li> </ul>		Go to Step (8)	_
6	Replace ECM Is the replacement complete?		Go to Step (8)	-
7	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-686 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 687-Relay Coil Short to Power (SPN 1485:FMI 3)

### **Conditions for Setting the DTC**

- Power relay check
- Check Condition-Key ON
- Fault Condition-Relay coil shorted to power

#### **Circuit Description**

The power relay switches power out to various sensors, actuators and solenoids in the fuel system. This fault will set if the ECM detects a short circuit to power on the relay control output.

#### **Diagnostic Aid**

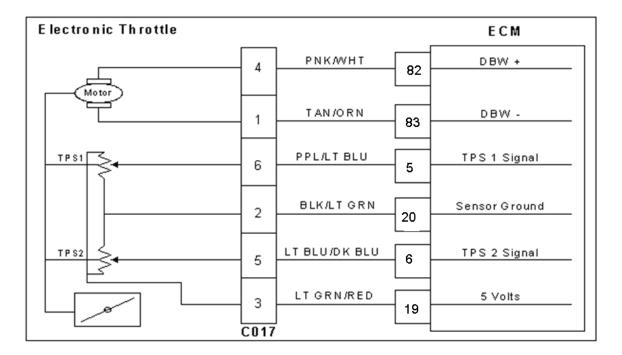

Relay coil resistance changes with temperature. The following diagnostic charts have steps to measure relay coil resistance values. When checking the resistance values be sure the relay is at a reasonable temperature, between +20 and +100 degrees F.

# DTC 687-Relay Coil Short to Power

Step	Action	Value(s)	Yes	Νο
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>DST connected and in the system data mode</li> <li>Key OFF</li> <li>Remove the power relay from the fuse block</li> <li>Using a DVOM check the resistance of the relay coil between terminals 1 and 2</li> <li>Is the resistance value less than 60 ohms?</li> </ul>		Go to Step (3)	Go to Step (4)
3	<ul> <li>Replace the power relay Is the replacement complete?</li> </ul>		Go to Step (9)	_
4	<ul> <li>Using a DVOM check for continuity between relay terminals 2 and 3</li> <li>Do you have continuity between them?</li> </ul>		Go to Step (3)	Go to Step (5)
5	<ul> <li>Key OFF</li> <li>Disconnect ECM wire harness connector C001</li> <li>Using a DVOM check for power between ECM pin 71 and engine ground with the key ON</li> <li>Do you have power?</li> </ul>	System bat- tery voltage	Repair the short to power. See wiring har- ness repair.	Go to Step (6)
6	Replace the power relay     Is the replacement complete?		Go to Step (7)	_
7	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-687 check for any stored codes.</li> <li>Does DTC 687 still re-set?</li> </ul>		Go to Step (8)	Go to Step (9)

Step	Action	Value(s)	Yes	No
8	Replace the ECM Is the replacement complete?		Go to Step (9)	_
9	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-687 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

# DTC 1111-Fuel Rev Limit (SPN 515:FMI 16)

## Conditions for Setting the DTC

- Fuel Rev Limit
- Check Condition-Engine Running
- Fault Condition-Engine rpm greater than set limit
- MIL-ON during active fault

#### **Circuit Description**

This fault will set anytime the engine rpm exceeds the specified speed settings in the calibration. This is generally set at 3000 rpms. The MIL command is ON during this active fault

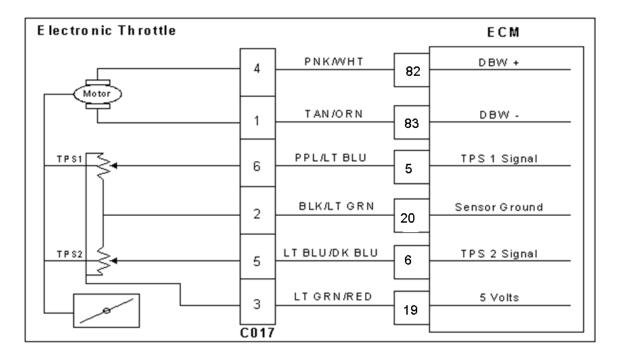

#### **Diagnostic Aid**

Always check for other stored DTC codes before using the following DTC chart for this code set. Repair any existing codes starting with the lowest numerical code first.

# DTC 1111-Fuel Rev Limit

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine OFF</li> <li>DST in Active Fault Mode</li> <li>Are any other DTC codes present with DTC 1111?</li> </ul>		Go to Step (3)	Go to Step (4)
3	<ul> <li>Diagnose and repair any other DTC codes be- fore proceeding with this chart.</li> <li>Have any other DTC codes been diagnosed and repaired?</li> </ul>		Go to Step (4)	-
4	<ul> <li>Check the service part Number on the ECM to ensure correct calibration is in use</li> <li>Is the service part Number Correct?</li> </ul>		Go to Step (6)	Go to Step 5
5	<ul> <li>Replace ECM with the correct service part number</li> <li>Is the replacement complete?</li> </ul>		Go to Step (9)	-
6	• Check the mechanical operation of the throttle Is the mechanical operation of the throttle OK?		Go to Step (8)	Go to Step (7)
7	<ul> <li>Correct mechanical operation of the throttle. Refer to Engine &amp; Component section</li> <li>Has the mechanical operation of the throttle been corrected?</li> </ul>		Go to Step (9)	-
8	<ul> <li>Check engine for large manifold vacuum leaks. Refer to Fuel Systems symptom diag- nostics</li> <li>Did you find and correct the vacuum leak?</li> </ul>		Go to Step (9)	Go to OBD System Check Sec- tion
9	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1111 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

# DTC 1112-Spark Rev Limit (SPN 515: FMI 0)

#### Conditions for Setting the DTC

- Spark Rev Limit
- Check Condition-Engine running
- Fault Condition-Engine rpm greater than set limit
- MIL-ON during active fault
- Engine Shut Down

#### **Circuit description**

This fault will set anytime the engine rpm exceeds the specified speed settings installed in the calibration. This is generally set at 3200 rpms. The MIL command is ON during this active fault and the engine will shut down.

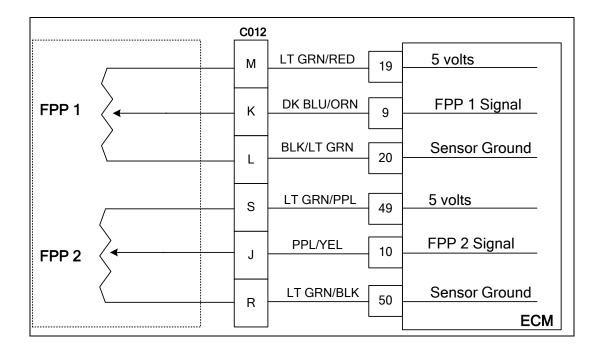

#### **Diagnostic Aid**

Always check for other stored DTC codes before using the following DTC chart for this code set. Repair any existing codes starting with the lowest numerical code first.

# DTC 1112-Spark Rev Limit

Step	Action	Value(s)	Yes	Νο
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine OFF</li> <li>DST connected</li> <li>Are any other DTC codes present with DTC 1112?</li> </ul>		Go to Step (3)	Go to Step (4)
3	<ul> <li>Diagnose any other DTC codes before pro- ceeding with this chart.</li> <li>Have any other DTC codes been diagnosed and repaired?</li> </ul>		Go to Step (4)	-
4	<ul> <li>Check the service part number on the ECM to ensure correct calibration is in use</li> <li>Is the service part number correct?</li> </ul>		Go to Step (6)	Go to Step 5
5	<ul> <li>Replace ECM with correct service part number</li> <li>Is the replacement complete?</li> </ul>		Go to Step (9)	-
6	• Check the mechanical operation of the throttle Is the mechanical operation of the throttle OK?		Go to Step (8)	Go to Step (7)
7	<ul> <li>Correct mechanical operation of the throttle. Refer to Engine &amp; Component section</li> <li>Has the mechanical operation of the throttle been corrected?</li> </ul>		Go to Step (9)	-
8	<ul> <li>Check engine for large manifold vacuum leaks. Refer to Fuel Systems section Symp- tom Diagnostics</li> <li>Did you find and correct the vacuum leak?</li> </ul>		Go to Step (9)	Go to OBD System Check Sec- tion
9	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1112 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

# DTC 1121 FPP 1 And 2 Redundancy Lost (SPN 91: FMI 31)

### **Conditions for Setting the DTC**

- Foot pedal position sensor 1 and 2
- Check Condition-Key ON
- Fault Condition-FPP1 and FPP 2 redundancy lost
- MIL-ON
- Force idle
- Low rev limit

### **Circuit Description**

The foot pedal position sensor uses variable resistors to determine signal voltage based on foot pedal position. Although the voltage outputs are different, the calculated throttle position values should be very close to the same. This fault will set if FPP 1 or FPP 2 positions are 20% greater or 20% less than the expected throttle position target. The MIL command is ON. Forced idle and low rev limit are in effect during this fault limiting full power output.

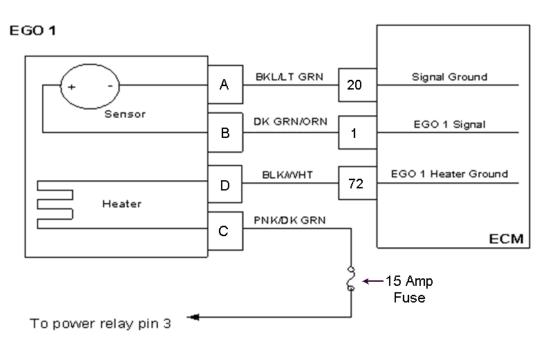

### **Diagnostic Aid**

It is very likely that in the event this code sets, other codes will set along with it. Always diagnose and repair codes starting with the lowest numerical value first. It is possible that by correcting the lower code sets first the problem will be corrected. FPP sensors are OEM specific and vary in configuration. The exact wire color and pin numbers for the FPP must be verified in the OEM chassis wiring schematic. The FPP sensor used in this system provides two sensors in one packaged assembly. FPP1 and FPP 2 are not serviceable individually, and in the event of a failure the complete FPP assembly must be replaced.

# DTC-1121 FPP 1 And 2 Redundancy Lost

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?		Go to Step (2)	Go to OBD System Check
2	<ul> <li>Diagnose any other lower numerical value codes that may be present first</li> <li>Did this resolve the problem?</li> </ul>		Go to Step (7)	Go to Step (3)
3	• Follow the diagnostic chart for DTC 2126 Did the chart resolve the problem?		Go to Step (7)	Go to Step (4)
4	• Follow the diagnostic chart for DTC 2121 Did the chart resolve the problem?		Go to Step (7)	Go to Step (5)
5	<ul> <li>Inspect FPP and C012 connector pins for damage corrosion or contamination</li> <li>Did you find the problem?</li> </ul>		Correct the problem as required. See wiring har- ness repair.	Go to Step (6)

# DTC 1151-Closed Loop Multiplier High LPG (SPN 4236:FMI 0)

### **Conditions for Setting the DTC**

- Heated Oxygen Sensor
- Check Condition-Engine running
- Fault Condition-Closed Loop multiplier out of range (greater than 35%)
- MIL-ON

#### **Circuit description**

The EGO sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and the adaptive multiplier. This fault sets if the Closed Loop multiplier exceeds the limits of normal operation and cannot correctly modify the fuel flow within its limits.

### **Diagnostic Aid**

**Oxygen Sensor Wire** Heated Oxygen sensor wires may be mis-routed and contacting the exhaust manifold. **Vacuum Leaks** Large vacuum leaks and crankcase leaks can cause a lean exhaust condition at especially at light load.

Fuel Mixer System can be lean due to faulty EPR (Electronic Pressure Regulator) or faulty fuel mixer.

**Fuel Pressure** Low fuel pressure, faulty fuel regulator or contaminated fuel filter can cause fuel the system to run lean

<u>Exhaust Leaks</u> If there is an exhaust leak, outside air can be pulled into the exhaust and past the 02 sensor causing a false lean condition.

Fuel Quality Contaminated or spoiled fuel can cause the fuel system to be lean.

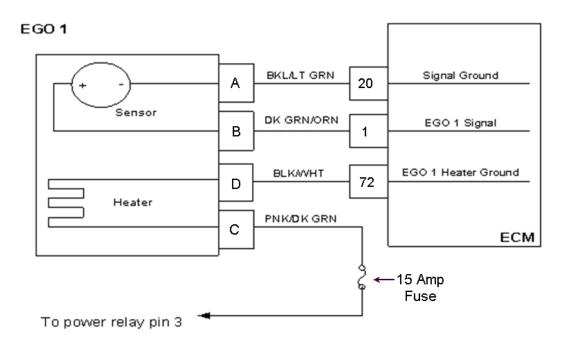

Ground Problem ECM grounds must be clean, tight and in the proper location.

## DTC 1152-Closed Loop Multiplier Low LPG (SPN 4236:FMI 1)

### **Conditions for Setting the DTC**

- Heated Oxygen Sensor
- Functional Fault-Closed Loop multiplier out of range (at limit of -35%)
- MIL Disabled

### **Circuit Description**

The EGO 1 sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and the adaptive multiplier. This fault sets if the Closed Loop multiplier exceeds the limits of normal operation. When the multiplier cannot correctly modify the fuel flow within its limits, it is limited at -35%.

### **Diagnostic Aid**

**<u>Fuel System</u>** High secondary fuel pressure will cause the system to run rich. A worn fuel mixer, faulty EPR (Electronic Pressure Regulator) may also cause the system to run rich.

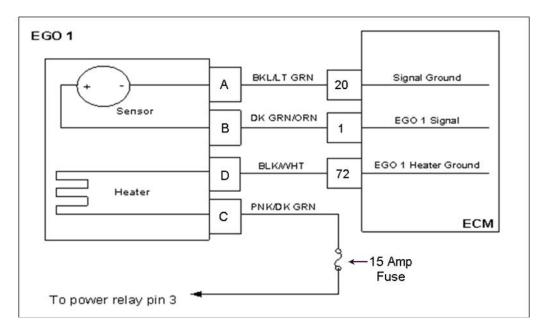

**Fuel Quality** A drastic variation in fuel quality (very high butane content) may cause the fuel system to run rich. Be sure that the specified HD-5 or HD-10 motor fuel grade LPG is used.

Air Filter A plugged, damaged or modified air filter may cause the system to run rich.

# DTC 1152 –Closed Loop Low LPG

# DTC 1156-Adaptive Learn Low (Gasoline) (SPN 4236:FMI 1)

### Conditions for Setting the DTC

- Heated Oxygen Sensor
- Check Condition-Engine running
- Fault Condition-Adaptive multiplier out of range greater than -30%
- MIL-ON

### **Circuit Description**

The EGO1 sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and Adaptive multiplier. This fault will set if the adaptive multiplier exceeds the limits of normal operation. Always run the fuel system diagnostics before using the following diagnostic chart.

#### **Diagnostic Aid**

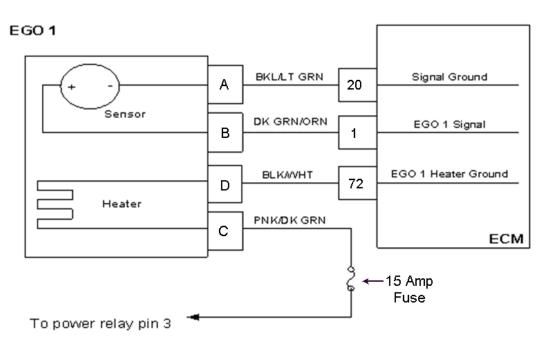

**Fuel System** High fuel pressure will cause the system to run rich. Fuel pressure is controlled by the ECM using a ground side driver. If the fuel pump is turned on all the time the fuel pressure will increase. Open or leaking injector will cause a rich condition.

**Fuel Quality** A drastic variation in fuel quality may cause the fuel system to run rich. **Air Filter** A plugged, damaged or modified air filter may cause the system to run rich.

### **Circuit Description**

The EGO 1 sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and Adaptive multiplier. This fault will set if the adaptive multiplier exceeds the limits of normal operation. Always run the fuel system diagnostic checks before using the following diagnostic chat.

#### **Diagnostic Aid**

**Oxygen Sensor Wire** Heated Oxygen sensor wires may be mis-routed and contacting the exhaust manifold.

<u>Vacuum Leaks</u> Large vacuum leaks and crankcase leaks can cause a lean exhaust condition at especially at light load.

**<u>Fuel Mixer</u>** System can be lean due to faulty EPR (Electronic Pressure Regulator) or faulty fuel mixer.

<u>Fuel Pressure</u> Low fuel pressure, faulty fuel regulator or contaminated fuel filter can cause fuel the system to run lean

**<u>Exhaust Leaks</u>** If there is an exhaust leak, outside air can be pulled into the exhaust and past the 02 sensor causing a false lean condition.

**Fuel Quality** Contaminated or spoiled fuel can cause the fuel system to be lean.

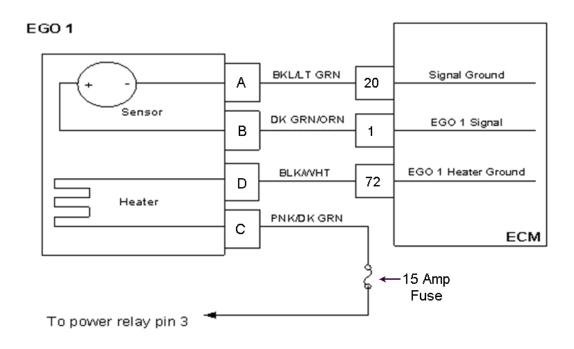

Ground Problem ECM grounds must be clean, tight and in the proper location.

## DTC 1162-Adaptive Learn Low (LPG) (SPN 4237:FMI 1)

## **Conditions for Setting the DTC**

- Heated Oxygen Sensor
- Check Condition-Engine running
- Fault Condition-Adaptive multiplier out of range greater than -30%
- MIL-ON

### **Circuit Description**

The EGO1 sensor is used to determine if the fuel flow to the engine is correct by measuring the oxygen content in the exhaust gas. The ECM uses this information to correct the fuel flow with the Closed Loop multiplier and Adaptive multiplier. This fault will set if the adaptive multiplier exceeds the limits of normal operation. Always run the fuel system diagnostics before using the following diagnostic chart.

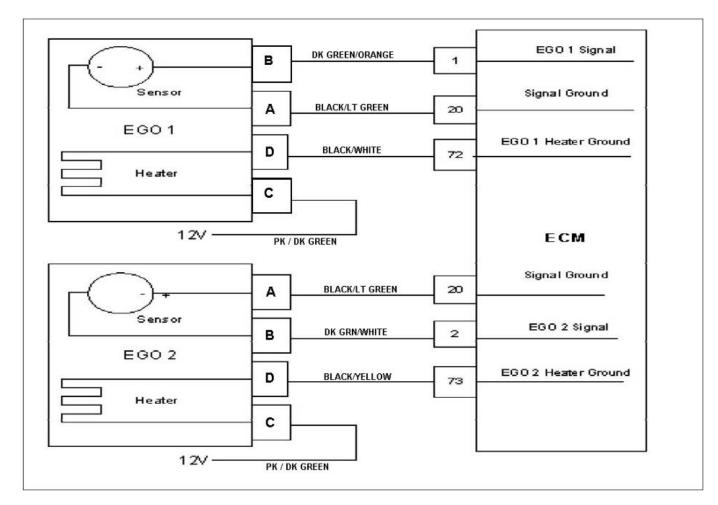

#### **Diagnostic Aid**

**Fuel System** High secondary fuel pressure will cause the system to run rich. A worn fuel mixer, faulty EPR (Electronic Pressure Regulator) may also cause the system to run rich. **Fuel Quality** A drastic variation in fuel quality (very high butane content) may cause the fuel system to run rich. Be sure that the specified HD-5 or HD-10 motor fuel grade propane is used. **Air Filter** A plugged, damaged or modified air filter may cause the system to run rich.

# DTC 1162-Adaptive Learn Low LPG

Step	Action	Value(s)	Yes	No
1	• Perform the On-Board (OBD) System Check? Are any other DTCs present?		Go to Step (3)	Go to Step (2)
2	<ul> <li>Visually and physically check the following items:</li> <li>The air intake duct for being collapsed or restricted</li> <li>The air filter for being plugged</li> <li>The EGO sensor is installed securely and the wire leads not damaged or contacting the secondary ignition wires</li> <li>ECM grounds for being clean and tight.</li> <li>Fuel system diagnostic checks</li> <li>Was a repair made?</li> </ul>		Go to Step (6)	Go to Step (4)

6	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1162 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

# DTC 1165-LPG Catalyst Monitor (SPN 3050:FMI 11)

### **Conditions for Setting the DTC**

- Catalyst Function
- Check condition- Engine running
- Fault condition- EGO 1 signal = EGO 2 signal for 100 updates
- MIL- On during active fault and for 1 second after active fault
- Adaptive- Disabled during active fault

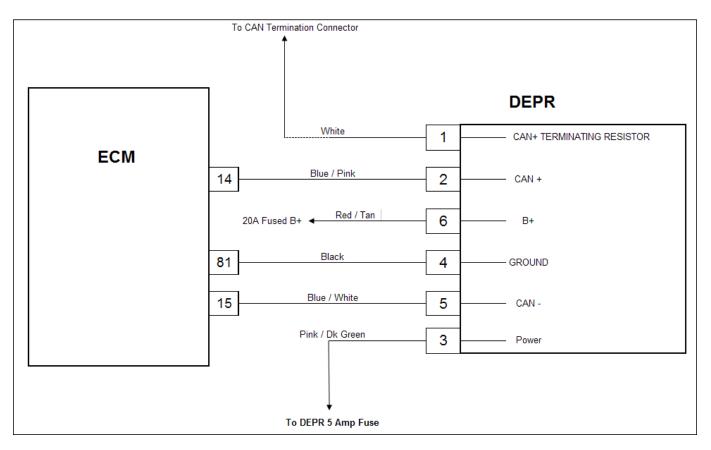

#### **Circuit Description**

The ECM uses EGO 1 and EGO 2 sensor signals to diagnose problems with the catalyst muffler. When the signals for EGO 1 & EGO 2 are similar it may indicate a problem with the catalyst.

#### **Diagnostic Aids**

Always diagnose any other troubles, stored along with DTC 420 first. Check for and eliminate any exhaust leaks prior to replacing catalyst muffler. Look for exhaust leaks at the catalyst muffler inlet and tail pipes. Clear this trouble code after repairing exhaust leaks, and recheck for code.

## DTC 1171-EPR Pressure Higher Than Expected (SPN 520260:FMI 0)

## **Conditions for Setting the DTC**

- EPR delivery pressure
- Check condition-Engine running or cranking
- MIL-ON during active fault
- Fault condition-EPR actual pressure greater than 1.5 inches above commanded pressure
- Adaptive disabled
- Closed loop disabled

#### **Circuit Description**

The EPR (Electronic Pressure Regulator) unit measures and controls the amount of fuel that is able to pass to the fuel mixer. This code will set in the event the actual pressure is 1.5 inches water pressure higher than the actual commanded pressure. Adaptive learn is disabled and the MIL command is ON during this fault.

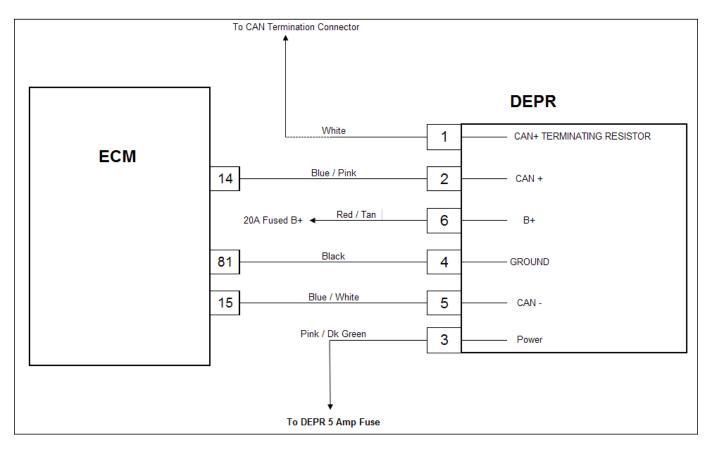

#### **Diagnostic Aid**

Always run the fuel system diagnostic pressure check before proceeding with the following diagnostic chart. High secondary fuel pressure due to a worn or damaged primary or secondary seat may cause this fault to set

# DTC 1171-EPR Pressure Higher Than Expected

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	Did you run the fuel pressure diagnostic test in the fuel system diagnostic section with no prob- lems found?		Go to Step (4)	Go to Step (3)
3	<ul> <li>Run the EPR pressure test in the fuel system diagnostic section</li> <li>Did the EPR pass the fuel pressure test specifi- cations?</li> </ul>		Go to Step (4)	Follow the EPR service recommenda- tions from the fuel pressure test chart.
4	<ul> <li>Inspect the EPR electrical connector pins C018 for damage, corrosion or contamina- tion.</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to wire har- ness repair section.	Go to Step (5)
5	<ul> <li>Replace or repair the EPR Is the replacement complete?</li> </ul>		Go to Step (6)	_
6	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC1171 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 1172-EPR Pressure Lower Than Expected (SPN 520260:FMI 1)

## **Conditions for Setting the DTC**

- EPR delivery pressure
- Check condition-Engine running or cranking
- MIL-ON during active fault
- Fault condition-EPR actual pressure less than 1.5 inches below commanded pressure
- Adaptive disabled
- Closed loop disabled

#### **Circuit Description**

The EPR (Electronic Pressure Regulator) unit measures and controls the amount of fuel that is able to pass to the fuel mixer. This code will set in the event the actual pressure is 1.0 inches water pressure lower than the actual commanded pressure. Adaptive is disabled and the MIL command is ON during this fault.

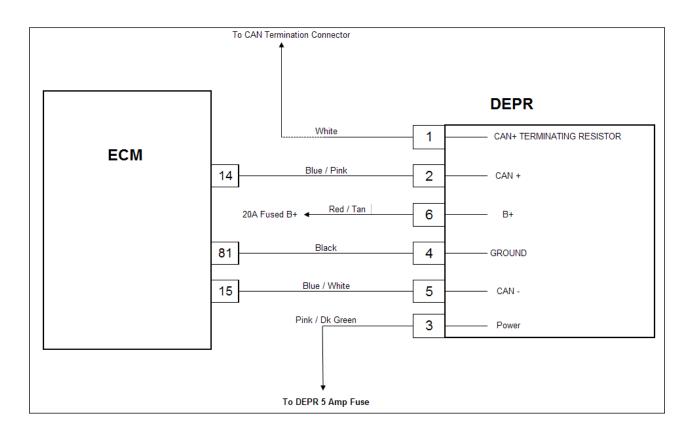

#### **Diagnostic Aid**

Always run the fuel system diagnostic pressure check before proceeding with the following diagnostic chart. Low secondary fuel pressure due to a fuel restriction or faulty regulator may cause this fault.

# DTC 1172-EPR Pressure Lower Than Expected

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	Did you run the fuel pressure diagnostic test in the fuel system diagnostic section with no prob- lems found?		Go to Step (4)	Go to Step (3)
3	<ul> <li>Run the EPR pressure test in the fuel system diagnostic section</li> <li>Did the EPR pass the fuel pressure test specifi- cations?</li> </ul>		Go to Step (4)	Follow the EPR service recommenda- tions from the fuel pressure test chart.
4	<ul> <li>Inspect the EPR electrical connector C018 for damage, corrosion or contamination.</li> <li>Did you find a problem?</li> </ul>		Repair the circuit as nec- essary. Refer to wire har- ness repair section.	Go to Step (5)
5	Replace or repair the EPR Is the replacement complete?		Go to Step (6)	_
6	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC1172 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

# DTC 1173-EPR Communication Lost (SPN 520260:FMI 31)

## **Conditions for Setting the DTC**

- EPR CAN communication
- Check condition-Engine running or cranking
- MIL-On during active fault
- Fault condition-No packets received within 500 ms
- Adaptive disabled

#### **Circuit Description**

The EPR (Electronic Pressure Regulator) unit measures and controls the amount of fuel that is able to pass to the fuel mixer. This code will set in the event communication with the ECM is lost. The MIL command is on.

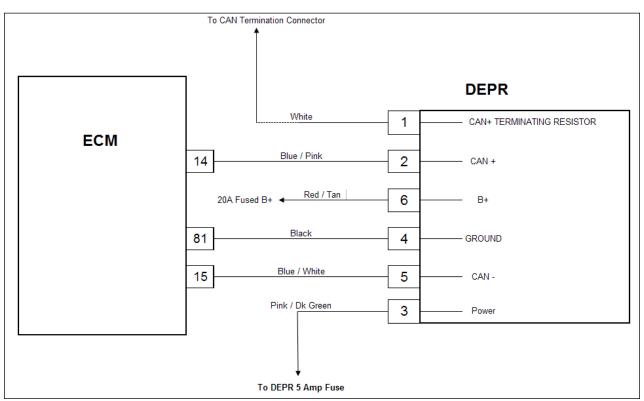

# DTC 1173-EPR Communication Lost

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON</li> <li>DST (Diagnostic Scan Tool) connected in the system data mode</li> <li>Clear DTC1173</li> <li>Key OFF</li> <li>Key ON, and attempt to start the engine Does DTC1173 re-set?</li> </ul>		Go to step (3)	Intermittent problem. ## DTC 1174-EPR Supply Voltage High (SPN 520260:FMI 3)

## Conditions for Setting the DTC

- EPR supply voltage
- Check condition-Engine running or cranking
- MIL-ON during active fault
- Fault condition-internal EPR supply voltage too high
- Adaptive disabled
- Closed loop disabled

### **Circuit Description**

The EPR (Electronic Pressure Regulator) unit measures and controls the amount of fuel that is able to pass to the fuel mixer. Pressure readings are sent over the CAN to the ECM and in return the ECM sends back a control signal to the EPR to increase or decrease pressure for precise mixture control. This code will set if the EPR internal supply voltage is too high.

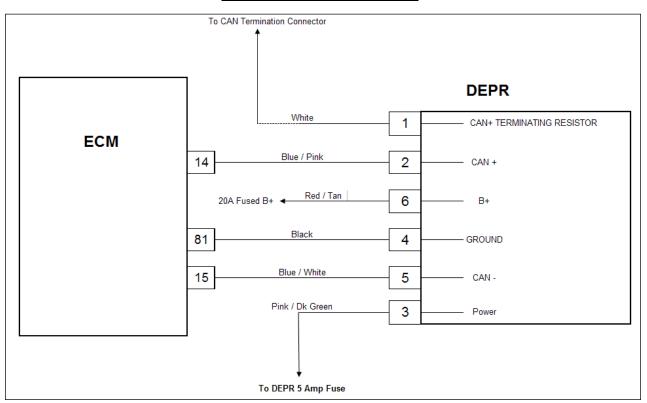

### **Diagnostic Aid**

This DTC indicates abnormal EPR internal voltages that are not measurable externally. Check the system charging voltage to be sure this DTC and other over voltage DTCs are not present. Repair the charging system if it is found to be out of specification for high charge voltage. In the event of multiple code sets, always start the diagnostic repair with the lowest numerical value DTC first.

# DTC 1174-EPR Voltage Supply High

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>DST connected and in the system data mode</li> <li>Engine running</li> <li>Check the system battery voltage.</li> <li>Is the charging voltage within specifications?</li> </ul>		Go to Step (3)	Repair the charging sys- tem

4	Replace the EPR     Is the replacement complete?		Go to Step (6)	_
5	<ul> <li>Replace the ECM Is the replacement complete?</li> </ul>		Go to Step (6)	_
6	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC1174 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### DTC 1175-EPR Supply Voltage Low (SPN 520260:FMI 4)

### Conditions for Setting the DTC

- EPR supply voltage
- Check condition-Engine running or cranking
- MIL-ON during active fault
- Fault condition-EPR internal supply voltage low
- Adaptive disabled

#### **Circuit Description**

The EPR (Electronic Pressure Regulator) unit measures and controls the amount of fuel that is able to pass to the fuel mixer. Pressure readings are sent over the CAN to the ECM and in return the ECM sends back a control signal to the EPR to increase or decrease pressure for precise mixture control. This code will set if the internal EPR supply voltage is low. Adaptive is disabled and the MIL command is ON.

#### **Diagnostic Aid**

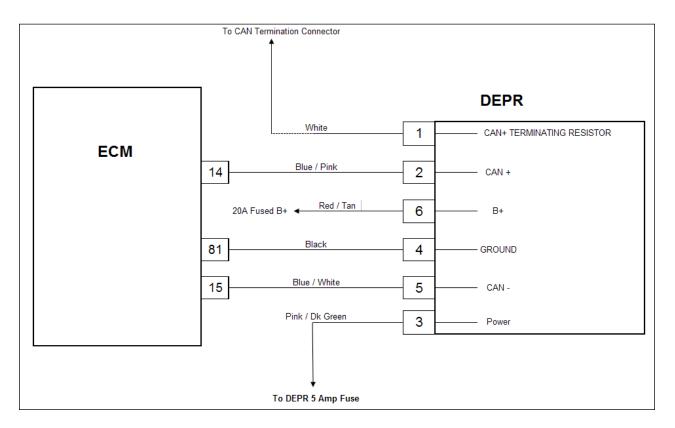

This DTC indicates abnormal EPR internal voltages that are not measurable externally. Check the system charging voltage to be sure this DTC and other low voltage DTCs are not present. Repair the charging system if it is found to be out of specification for low charge voltage. In the event of multiple code sets, always start the diagnostic repair with the lowest numerical value DTC first.

# DTC 1175-EPR Voltage Supply Low

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>DST connected and in the system data mode</li> <li>Engine running</li> <li>Check the system battery voltage.</li> <li>Is the charging voltage within specifications?</li> </ul>		Go to Step (3)	Repair the charging sys- tem
3	<ul> <li>Key OFF</li> <li>Disconnect the EPR electrical connector C018</li> <li>Using a DVOM check for power between the EPR connector pin 7 and engine ground.</li> <li>Key ON</li> <li>Record the voltage reading.</li> <li>(Be sure to activate relay control ON using the DST function or check before ECM relay control times out)</li> <li>Using a DVOM check the system battery power at the battery terminals and record the voltage reading.</li> <li>Are the recorded voltage readings within 1 volt of each other?</li> </ul>		Go to Step (6)	Go to Step (4)
4	<ul> <li>Inspect the EPR connector and F5 fuse holder terminals for damage corrosion or contamination</li> <li>Did you find a problem?</li> </ul>		Correct the problem as necessary. See wiring harness re- pair in the electrical sec- tion of this manual	Go to Step (5)
5	<ul> <li>Check the power relay circuit. Check the power relay connections for damage corro- sion or contamination</li> <li>Did you find a problem?</li> </ul>		Correct the problem as necessary. See wiring harness schematic in the electrical section of this manual	_

Step	Action	Value(s)	Yes	No
6	<ul> <li>Key OFF</li> <li>Disconnect the ECM connector C001</li> <li>Using a DVOM check the resistance reading between EPR connector pin 6 and ECM connector pin 69 and 81.</li> <li>(Do not forget to subtract any resistance value that may be present in your test cables)</li> <li>Is the resistance reading less than 0.5 ohms?</li> </ul>	Less than 0.5 ohms	Go to Step (7)	Repair the poor EPR power ground circuit. See wiring har- ness repair in the electrical section of this manual
7	Replace the EPR Is the replacement complete?		Go to Step (8)	_
8	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC1175 check for any stored codes.</li> <li>Does DTC 1175 still re-set?</li> </ul>		Go to Step (9)	System OK

### DTC 1176-EPR Internal Actuator Fault (SPN 520260:FMI 12)

### Conditions for Setting the DTC

- EPR internal actuator test
- Check condition-Engine running or cranking
- MIL-ON during active fault
- Fault condition-Failed actuator
- Adaptive disabled

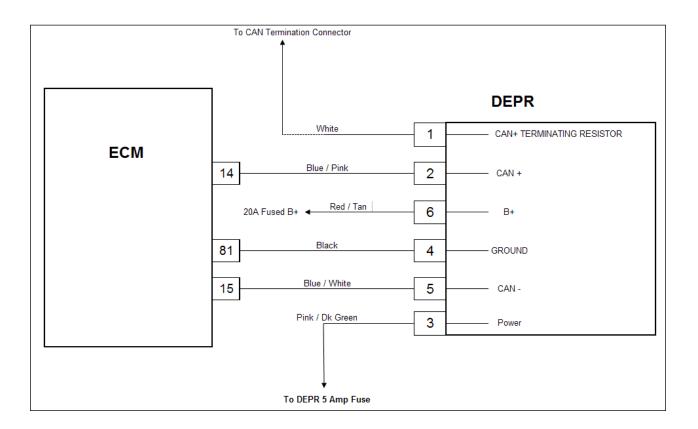

#### **Circuit Description**

The EPR (Electronic Pressure Regulator) unit measures and controls the amount of fuel that is able to pass to the fuel mixer. Pressure readings are sent over the CAN to the ECM and in return the ECM sends back a control signal to the EPR to increase or decrease pressure for precise mixture control. This code will set if the ECM detects an internal actuator fault with the EPR. In the event of multiple code sets, always start the diagnostic repair with the lowest numerical value DTC first. In most instances the EPR will need to be replaced in the event of this code set.

# DTC 1176-EPR Internal Actuator Fault

### DTC 1178-EPR Internal Communication Error (SPN 520260:FMI 12)

### Conditions for Setting the DTC

- EPR internal communication test
- Check condition-Engine running or cranking
- MIL-ON during active fault
- Fault condition-
- Adaptive disabled

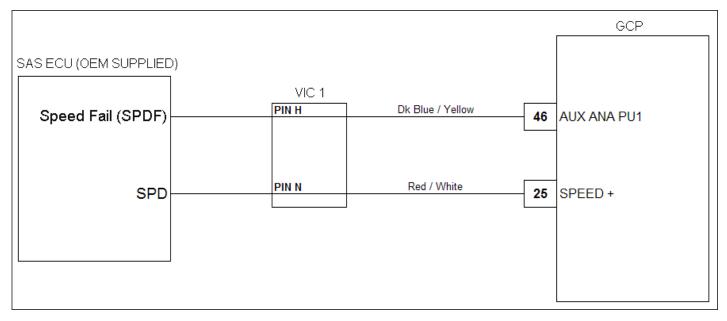

#### **Circuit Description**

The EPR (Electronic Pressure Regulator) unit measures and controls the amount of fuel that is able to pass to the fuel mixer. Pressure readings are sent over the CAN to the ECM and in return the ECM sends back a control signal to the EPR to increase or decrease pressure for precise mixture control. This code will set if the ECM detects an internal communication error in the EPR. In the event of multiple code sets, always start the diagnostic repair with the lowest numerical value DTC first. In most instances the EPR will need to be replaced in the event of this code set.

# DTC 1178-EPR Internal Comm Fault

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>DST connected and in the system data mode.</li> <li>Check for any other current or active DTCs Does the DST show any other codes set?</li> </ul>		Go to Step (3)	Go to Step (6)
3	<ul> <li>Repair any other DTCs set starting with the lowest DTC number first.</li> <li>Have the other DTCs set been corrected?</li> </ul>		Go to Step (4)	_
4	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature.</li> <li>Observe the MIL.</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC1178 check for any stored codes.</li> <li>Does DTC 1178 still re-set?</li> </ul>		Go to Step (5)	System OK
5	Replace the EPR Is the replacement complete?		Go to Step (6)	_
6	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature.</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC1178 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 1511 – Auxiliary Analog PU 1 High Voltage (SPN 701:FMI 3)

#### **Conditions for setting the DTC**

- Voltage on Aux Analog PU1 is 5.0v or greater for longer than 1 second
- Wiring issue between Vehicle Interface Connector 1 (VIC 1) and pin 46 at ECM
- Wiring issue between VIC 1 and OEM supplied speed computer
- MIL light on during fault
- Power Derate 2 enabled

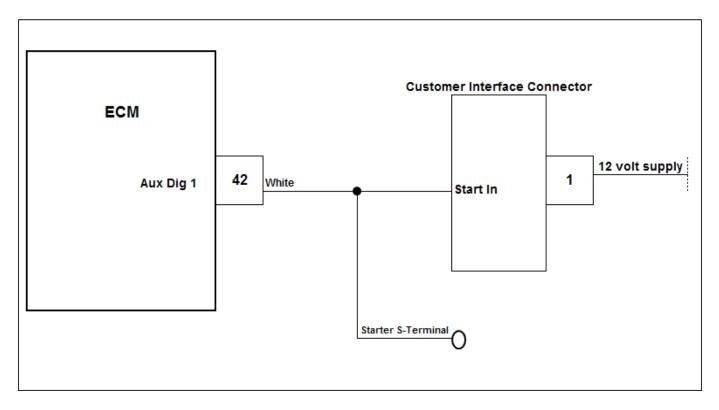

#### **Circuit Description**

The AUX PU1 is pulled-up to 5 VDC inside the ECM therefore; if SPDF input becomes an open-circuit into the ECU the input will remain at 5 VDC. The OEM supplied controller grounds the SPDF circuit when the vehicle is stopped. As a result, the fault

is configured in the ECU on an AUX PU1 High Voltage state if voltage reached 5.0v for longer than 1 second. This informs the technician that the circuit is open. The technician should verify the wiring is good from the OEM supplied speed computer to the ECM module. If the wiring is ok, the problem is likely in the OEM system.

# DTC 1511 – Auxiliary Analog PU 1 High Voltage

STEP	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Section
2	<ul> <li>Key ON</li> <li>DST (Diagnostic Scan Tool) connected</li> <li>On the Raw Volts page, check the value for Aux_ana_PU1</li> <li>Does the DST display 4.9v or greater?</li> </ul>	4.9v or Greater	Go to Step (3)	Intermittent problem Go to Intermittent section Check for bad wiring in the circuit
3	<ul> <li>Key off and battery disconnected</li> <li>Provide a good ground circuit to pin H at VIC 1</li> <li>Reconnect battery and turn the key on, does the page still indicate 4.9v or greater?</li> </ul>	4.9v or Greater	Go to Step (4)	Repari circuit issue between OEM supplied speed computer and Pin H at the VIC 1
4	<ul> <li>Key off and battery disconnected</li> <li>Remove ground circuit installed in step 3, reinstall OEM wiring</li> <li>Provide a good ground circuit to Pin 46 at the GCP Connector</li> <li>Reconnect battery and turn the the key on, does the raw volts page still indicate 4.9v or greater?</li> </ul>	4.9v or Greater	Refer to OEM for diagnosis of speed control system	Repair wire circuit issue between VIC 1 and GCP pin 46

#### Conditions for setting the DTC

- Engine RPM between 60 rpm and 220 rpm
- Voltage at Aux Dig 1 at the ECM (Pin 42) is less than 4 volts for greater than 1 second
- Check Condition- Engine cranking

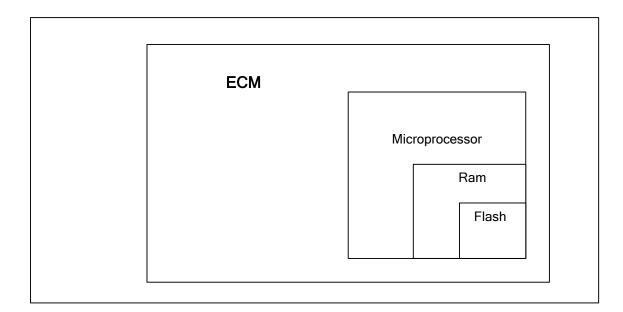

#### **Circuit Description**

Aux Digital 1 is used to detect when the operator is cranking the engine by monitoring the key switch "start" position voltage potential. When the operator attempts to start the engine a 12 volt signal is sent through the customer interface connector "start in" terminal. The circuit carries the voltage to the S-Terminal of the starter which will begin engine cranking. The circuit has a splice which also carries the voltage to terminal 42 of the ECM "Aux Dig 1". When B+ voltage is present at terminal 42 Aux Dig 1, the ECM knows the engine is cranking. This fault code is used to detect a circuit malfunction in which the engine is cranking and there is less than 4 volts at terminal 42 at the ECM.

### DTC 1552: AUX digital 1 low voltage (SPN 520222: FMI 04)

STEP	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	_	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Engine Cranking</li> <li>DST (Diagnostic Scan Tool) connected on the Raw Volts page</li> <li>Does AUX_DIG1_Raw Display less than 4 volts?</li> </ul>	< 4 Volts	Go to Step (3)	ECM De- fective, Replace ECM
3	<ul> <li>Engine Cranking</li> <li>Connect DVOM as instructed below</li> <li>Back probe Aux Dig 1 White wire at terminal 42 of the ECM header connector and ground other DVOM lead</li> <li>Do you get greater than 4 volts?</li> </ul>	> 4 Volts	Repair faulty ter- minal at pin 42 of the wire harness Aux dig 1 White wire	Repair open circuit from starter solenoid splice to terminal 42 at the ECM header connector

## DTC 1612-RTI 1 Loss (SPN 629:FMI 31)

#### **Conditions for Setting the DTC**

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Adaptive-Disabled for the remainder of the key-ON cycle

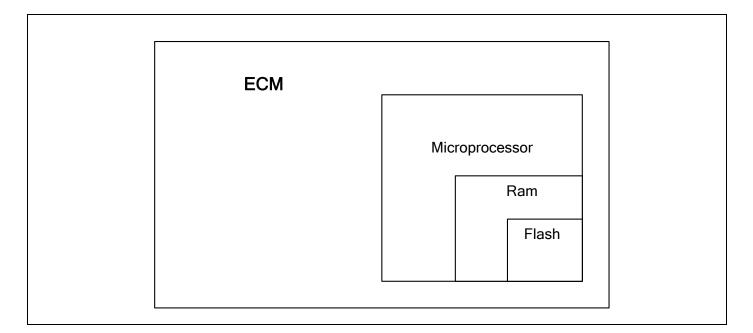

#### **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST.

## DTC 1612-RT 1 Loss

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC 1612 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	Check ECM power and ground circuits Did the power and ground circuits check OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	Replace ECM Is the replacement complete?		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1612 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 1613-RTI 2 Loss (SPN 629:FMI 31)

#### **Conditions for Setting the DTC**

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Adaptive-Disabled for the remainder of the key-ON cycle

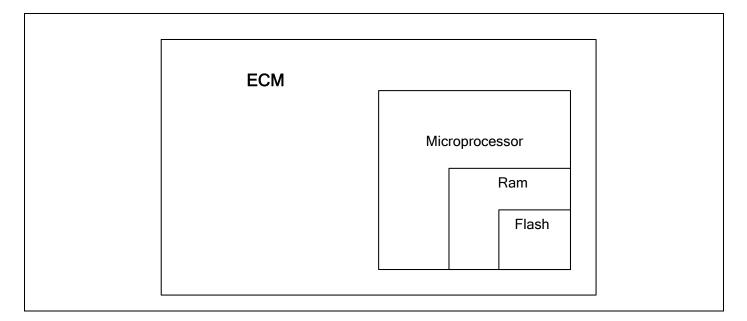

#### **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST.

## DTC 1613-RTI 2 Loss

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC 1613 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	Check ECM power and ground circuits Did the power and ground circuits check OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	Replace ECM Is the replacement complete?		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1613 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 1614-RTI 3 Loss (SPN 629:FMI 31)

#### **Conditions for Setting the DTC**

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Adaptive-Disabled for the remainder of the key-ON cycle

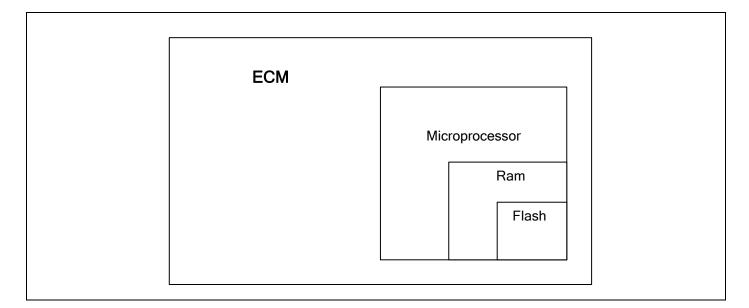

#### **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST.

## DTC 1614-RTI 3 Loss

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion

3	Check ECM power and ground circuits Did the power and ground circuits check OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	Replace ECM Is the replacement complete?		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1614 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 1615-A/D Loss (SPN 629:FMI 31)

#### **Conditions for Setting the DTC**

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Adaptive-Disabled for the remainder of the key-ON cycle

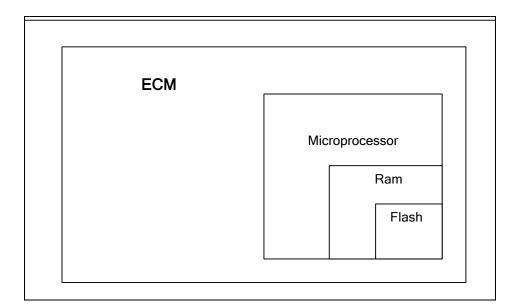

#### **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST.

## DTC 1615-A/D Loss

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC 1615 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	Check ECM power and ground circuits Did the power and ground circuits check OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	<ul> <li>Replace ECM</li> <li>Is the replacement complete?</li> </ul>		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1615 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 1616-Invalid Interrupt (SPN 629:FMI 31)

#### **Conditions for Setting the DTC**

- Engine Control Module
- Check Condition-Key on
- Fault Condition-Internal microprocessor error
- MIL-ON
- Adaptive-Disabled for the remainder of the key-ON cycle

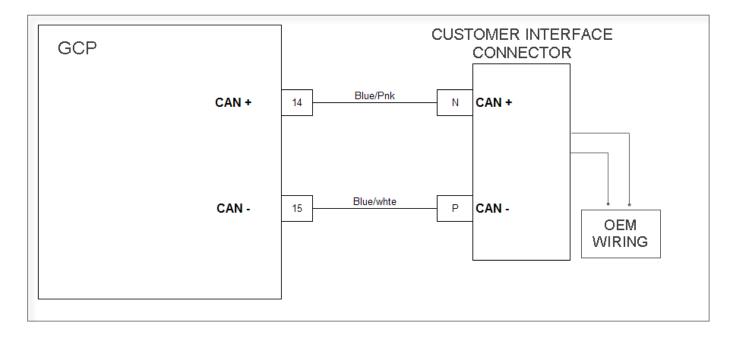

#### **Circuit Description**

The ECM has several internal checks that must be satisfied each time an instruction is executed. Several different things can happen within the microprocessor that will cause this fault. The ECM will attempt to reset itself in the event this fault is set. The MIL command is on and will remain on until the code is cleared using the DST.

# DTC 1616-Invalid Interrupt

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC 1616 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	Check ECM power and ground circuits Did the power and ground circuits check OK?		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	Replace ECM Is the replacement complete?		Go to Step (5)	-
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1616 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### DTC 1625 - J1939 Shutdown Request (SPN 1110:FMI 31)

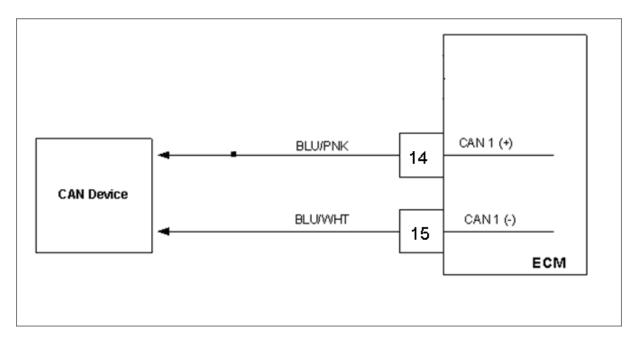

#### Conditions for Setting the DTC

- Fault signal from OEM device
- Check Condition-Engine running
- MIL-ON

#### **Circuit description**

The OEM can connect to the J1939 circuit (CAN circuit) at the customer interface connector 2. The terminals are N and P and continue through the engine wire harness into the ECM header connector. The terminals at the ECM for J1939 are pins 14 and 15. This DTC will set if the OEM device hooked into terminals N and P at the customer interface connector commands the engine to shut down.

### DTC 1626-CAN Tx Failure (SPN: 639 FMI: 12)

#### **Conditions for Setting the DTC**

- CAN Tx
- Check Condition-Engine running
- Fault Condition-CAN Tx error 120 packets lost within 1 second
- MIL-ON

#### **Circuit description**

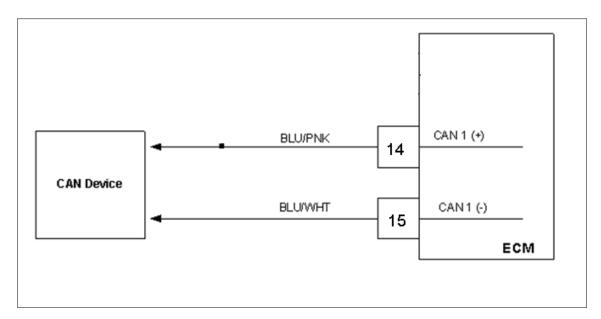

The CAN bus (controller area network) is used by the ECM to communicate with other digital devices used throughout the fuel system. Information is sent over the CAN bus in digital information "packets" that contain information for various control functions. This fault will set if the ECM detects 120 packets lost within a one second time period. The MIL command is ON.

# DTC 1626-CAN Tx Failure

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC1626 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	<ul> <li>Check that the ECM power connection C019 is clean, tight and in the proper location.</li> <li>Check that the ECM ground connection C010 is clean, tight and in the proper location.</li> <li>Are the power and ground circuits OK?</li> </ul>		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	<ul> <li>Using a DVOM check for continuity between ECM pins 14 and 15</li> <li>Do you have continuity between them?</li> </ul>		Repair the shorted circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (5)
5	<ul> <li>Using a DVOM check for continuity to engine ground on pins 69 and 81</li> <li>Do have continuity to engine ground?</li> </ul>		Repair the shorted to ground circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (6)
6	<ul> <li>Using a DVOM check for continuity to battery positive on pins 69 and 81</li> <li>Do have continuity them?</li> </ul>		Repair the shorted to ground circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (7)
7	Replace the ECM Is the replacement complete?		Go to Step (8)	_

Step	Action	Value(s)	Yes	No
8	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1626 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### DTC 1627-CAN Rx Failure (SPN 639:FMI 12)

### **Conditions for Setting the DTC**

- CAN Rx
- Check Condition-Engine running
- Fault Condition-CAN Rx error 120 packets lost within 1 second
- MIL-ON

#### **Circuit description**

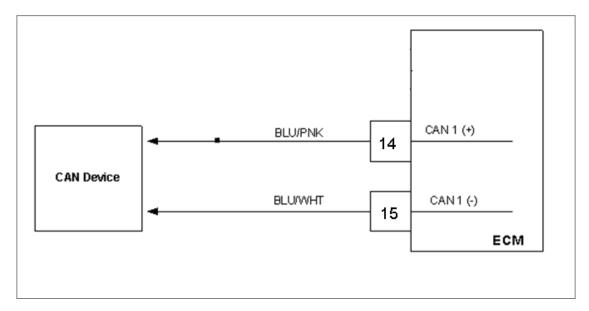

The CAN bus (controller area network) is used by the ECM to communicate with other digital devices used throughout the fuel system. Information is sent over the CAN bus in digital information "packets" that contain information for various control functions. This fault will set if the ECM detects 120 packets lost within a one second time period. The MIL command is ON.

## DTC 1627-CAN Rx Failure

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC1627 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	<ul> <li>Check that the ECM power connection C019 is clean, tight and in the proper location.</li> <li>Check that the ECM ground connection C010 is clean, tight and in the proper location.</li> <li>Are the power and ground circuits OK?</li> </ul>		Go to Step (4)	Repair the circuit as nec- essary. Refer to Wiring Re- pairs in Engine Elec- trical.
4	<ul> <li>Using a DVOM check for continuity between ECM pins 14 and 15</li> <li>Do you have continuity between them?</li> </ul>		Repair the shorted circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (5)
5	<ul> <li>Using a DVOM check for continuity to engine ground on pin 14.</li> <li>Do have continuity to engine ground?</li> </ul>		Repair the shorted to ground circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (6)
6	<ul> <li>Using a DVOM check for continuity to battery positive on pin 14.</li> <li>Do have continuity between them?</li> </ul>		Repair the shorted to ground circuit as necessary. Refer to Wir- ing Repairs in Engine Elec- trical.	Go to Step (7)
7	Replace the ECM Is the replacement complete?		Go to Step (8)	_

Step	Action	Value(s)	Yes	No
8	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1627 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

## DTC 1628-CAN Address Conflict (SPN 639:FMI 13)

#### **Conditions for Setting the DTC**

- CAN Rx
- Check Condition-Engine running
- Fault Condition-5 or more address conflict errors
- MIL-ON

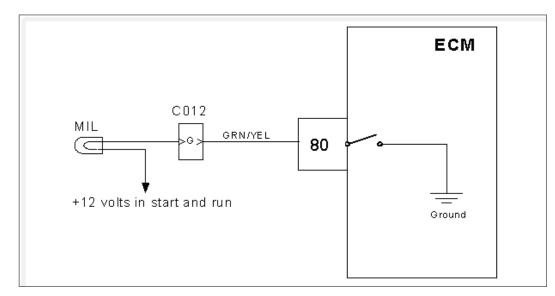

#### **Circuit description**

The CAN bus (controller area network) is used by the ECM to communicate with other digital devices used throughout the fuel system. Information is sent over the CAN bus in digital information "packets" that contain information for various control functions. Individual devices are assigned network addresses. This fault will set if the ECM detects an address conflict, such as two devices with the same address. This is usually not due to an infield failure and may be the results of "add on" CAN devices

## DTC 1628-CAN Address Conflict

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Does DTC1628 reset with the engine idling?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	<ul> <li>Key OFF</li> <li>Disconnect one CAN device</li> <li>Clear DTC 1628</li> <li>Key ON (start engine if possible if not continue cranking for at least 3 seconds)</li> <li>Wait 5 seconds</li> <li>Does DTC 1628 re-set?</li> </ul>		Repeat step 3 until all CAN devices have been discon- nected one at a time	Contact the CAN device manufacturer for additional CAN address information Go to Step (4)
4	Has the CAN device been replaced or address conflict resolved?		Go to Step (5)	_
5	<ul> <li>Remove all test equipment except the DST.</li> <li>Connect any disconnected components, fuses, etc.</li> <li>Using the DST clear DTC information from the ECM.</li> <li>Turn the ignition OFF and wait 30 seconds.</li> <li>Start the engine and operate the vehicle to full operating temperature</li> <li>Observe the MIL</li> <li>Observe engine performance and drivability</li> <li>After operating the engine within the test parameters of DTC-1628 check for any stored codes.</li> <li>Does the engine operate normally with no stored codes?</li> </ul>		System OK	Go to OBD System Check

### DTC 1644-MIL Control Ground Short (SPN 1213:FMI 4)

### Conditions for setting the DTC

- MIL
- Check Condition-Key ON engine OFF
- Fault Condition-ECM MIL output shorted to ground
- MIL Command-ON

#### **Circuit Description**

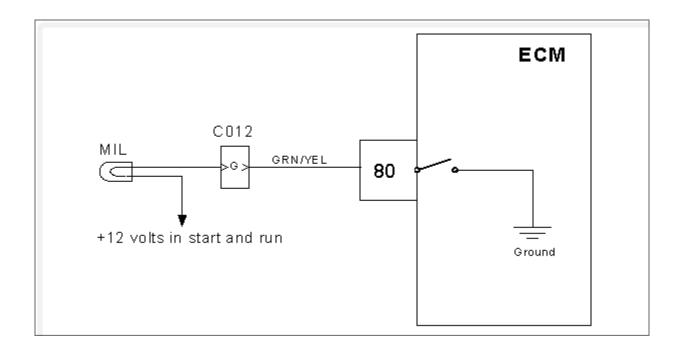

The Spectrum Fuel system is equipped with OBD (On-Board Diagnostics). The system has a dash mounted MIL (Malfunction Indicator Lamp). The MIL serves as notification of an emissions related problem. The MIL also has the ability to flash DTC codes in what is referred to as the blink code mode. It will display DTCs that have been stored due to a possible system malfunction. The following DTC charts in this manual will instruct the technician to perform the OBD system check. This simply means to verify the operation of the MIL. The lamp should illuminate when the key is in the ON position, and the engine is not running. This feature verifies that the lamp is in proper working order. If the lamp does not illuminate with the vehicle key ON and engine OFF, repair it as soon as possible. Once the engine is in start or run mode, the lamp should go off. If the lamp stays on while the engine is in the start or run mode, a current diagnostic trouble code may be set or a problem may exist with the MIL electrical wiring. The electrical schematic above shows the MIL power source supplied to the lamp. The ECM completes the circuit to ground to turn the lamp ON. This fault will set if the ECM MIL control is shorted to ground.

## DTC 1644-MIL Control Ground Short

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON, Engine Running</li> <li>DST (Diagnostic Scan Tool) connected in System Data Mode</li> <li>Clear system fault code</li> <li>Key OFF</li> <li>Key ON</li> <li>Does DTC 1644 reset?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section
3	<ul> <li>Key OFF</li> <li>Disconnect the ECM wire harness connector C001</li> <li>Using a DVOM check for continuity between ECM connector pin 5 and engine ground Do you have continuity?</li> </ul>		Go to Step (4)	Intermittent problem Go to Inter- mittent section
4	<ul> <li>Disconnect vehicle interface connector C012</li> <li>Using a DVOM check for continuity between ECM connector pin 80 and engine ground Do you have continuity?</li> </ul>		Repair the shorted to ground circuit between the ECM con- nector and engine ground. ## DTC 1645-MIL Control Ground Short To Power (SPN 1213:FMI 3)

## Conditions for setting the DTC

- MIL check
- Check Condition-Key ON engine OFF
- Fault Condition-ECM MIL output shorted to voltage
- MIL Command-ON

## **Circuit Description**

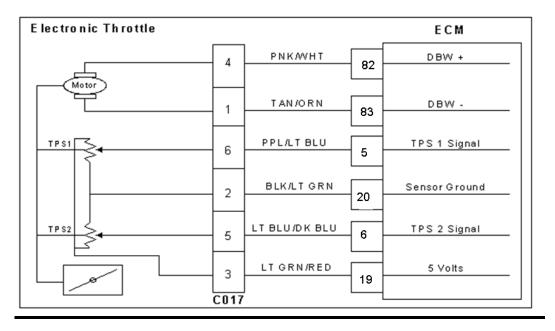

The Spectrum Fuel system is equipped with OBD (On-Board Diagnostics). The system has a dash mounted MIL (Malfunction Indicator Lamp). The MIL serves as notification of an emissions related problem. The MIL also has the ability to flash DTC codes in what is referred to as the blink code mode. It will display DTCs that have been stored due to a possible system malfunction. The following DTC charts in this manual will instruct the technician to perform the OBD system check. This simply means to verify the operation of the MIL. The lamp should illuminate when the key is in the ON position, and the engine is not running. This feature verifies that the lamp is in proper working order. If the lamp does not illuminate with the vehicle key ON and engine OFF, repair it as soon as possible. Once the engine is in start or run mode, the lamp should go off. If the lamp stays on while the engine is in the start or run mode, a current diagnostic trouble code may be set or a problem may exist with the MIL electrical wiring. The electrical schematic above shows the MIL power source supplied to the lamp. The ECM completes the circuit to ground to turn the lamp ON. This fault will set if the ECM MIL control is shorted to voltage.

## DTC 2111-Unable To Reach Lower TPS (SPN 51:FMI 7)

## **Conditions for Setting the DTC**

- Throttle Position Sensor
- Check Condition-Cranking or Running
- Fault Condition-Actual throttle position is 20% greater than the throttle command
- MIL-ON during active fault
- Engine shutdown

## **Circuit Description**

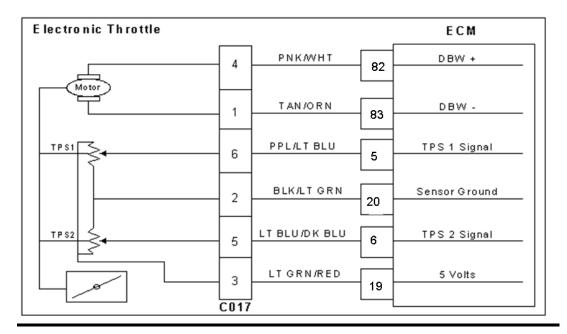

Dual throttle Position Sensors are used within the throttle that use variable resistors to determine signal voltage based on throttle plate position. TPS 1 will read low voltage when closed and TPS 2 will read high voltage when closed. The TPS 1 and TPS 2 percentages are calculated from these voltages. Although the voltages are different, the calculated values for the throttle position percentages should be very close to the same. The TPS values are used by the ECM to determine if the throttle is opening as commanded. This fault will set if the actual throttle position is 20% greater than the throttle command. During this active fault the MIL command is ON and the engine will shut down.

## DTC 2121-FPP 1 Lower Than FPP 2 (SPN 91:FMI 18)

## **Conditions for Setting the DTC**

- Foot pedal position sensor 1 and 2
- Check Condition-Key ON
- Fault Condition-FPP1 sensor higher than FPP 2
- MIL-ON
- Force idle
- Low rev limit

## **Circuit Description**

The foot pedal position sensor uses variable resistors to determine signal voltage based on foot pedal position. Although the voltage outputs are different, the calculated throttle position values should be very close to the same. This fault will set if FPP 1 is 20% or greater than the FPP 2. The MIL command is ON. Forced idle and low rev limit are in effect during this fault limiting full power output.

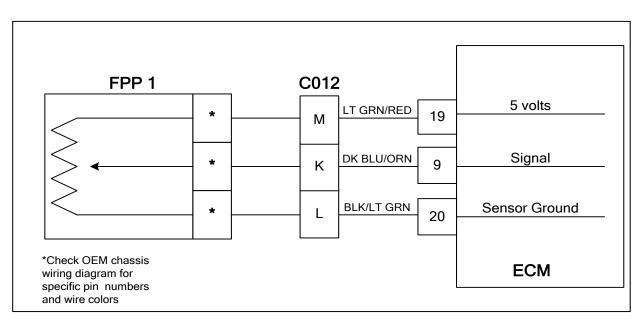

#### **Diagnostic Aid**

FPP sensors are OEM specific and vary in configuration. The exact wire color and pin numbers for the FPP must be verified in the OEM chassis wiring schematic. The FPP sensor used in this system provides two sensors in one packaged assembly. FPP1 and FPP 2 are not serviceable individually, and in the event of a failure the complete FPP assembly must be replaced.

## DTC 2122-FPP 1 High Voltage (SPN 91:FMI 3)

## **Conditions for Setting the DTC**

- Foot Pedal Position
- Check Condition-Key On
- Fault Condition-FPP1 sensor voltage exceeds 4.800 volts
- MIL-On during active fault
- Low rev limit
- Forced idle

## **Circuit Description**

The Foot Pedal Position sensor uses a variable resistor to determine signal voltage based on pedal position. This fault will set if the FPP 1 voltage exceeds 4.800 volts for longer than 0.5 seconds. If the voltage exceeds 4.800 volts the FPP is considered to be out of specification. The MIL command is ON. Forced idle will be in effect during this code set limiting full power output.

#### **Diagnostic Aid**

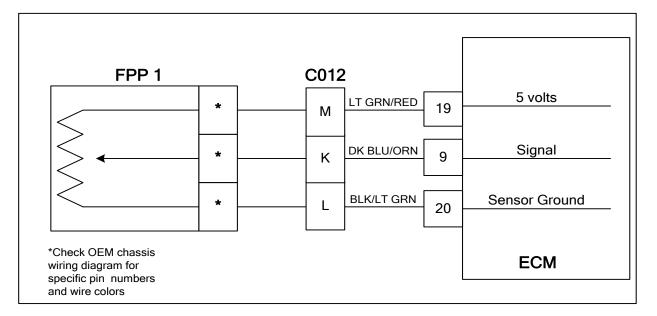

FPP sensors are OEM specific and vary in configuration. The exact wire color and pin numbers for the FPP connection must be verified in the OEM chassis wiring schematic. The FPP sensor used in this system provides two sensors in one packaged assembly. FPP1 and FPP 2 are not serviceable individually, and in the event of a failure the complete foot pedal sensor assembly must be replaced.

## DTC 2123-FPP 1 Low Voltage (SPN 91:FMI 4)

## **Conditions for Setting the DTC**

- Foot Pedal Position
- Check Condition-Key On
- Fault Condition-FPP sensor voltage less than 0.200
- MIL-On during active
- Low rev limit
- Force idle

## **Circuit Description**

The Foot Pedal Position sensor uses a variable resistor to determine signal voltage based on pedal position. This fault will set if the FPP 1 voltage is less than 0.200 volts at any operating condition while the key is on. If the voltage drops below 0.200 volts the FPP is considered to be out of specification. The MIL command is ON. Forced idle will be in effect during this code set limiting full power output.

## **Diagnostic Aid**

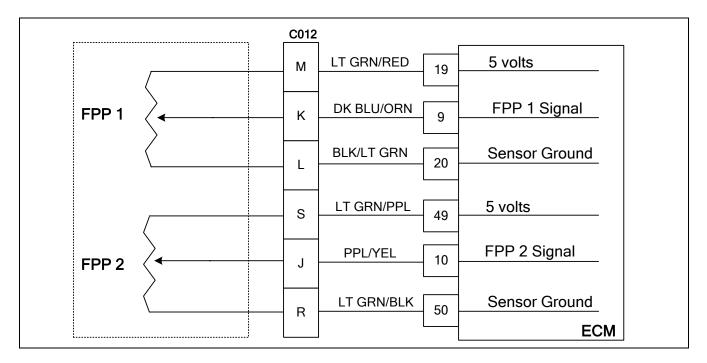

FPP sensors are OEM specific and vary in configuration. The exact wire color and pin numbers for the FPP connection must be verified in the OEM chassis wiring schematic. The FPP sensor used in this system provides two sensors in one packaged assembly. FPP1 and FPP 2 are not serviceable individually, and in the event of a failure the complete foot pedal sensor assembly must be replaced.

## DTC 2126-FPP 1 Higher Than FPP 2 (SPN 91:FMI 16)

## **Conditions for Setting the DTC**

- Foot pedal position sensor 1 and 2
- Check Condition-Key ON
- Fault Condition-FPP 1 20% higher than FPP 2
- MIL-ON
- Force idle
- Low rev limit

#### **Circuit Description**

The foot pedal position sensor uses variable resistors to determine signal voltage based on foot pedal position. Although the voltage outputs are different, the calculated throttle position values should be very close to the same. This fault will set if FPP 1 is 20% or more higher that FPP 2. The MIL command is ON. Forced idle and low rev limit are in effect during this fault limiting full power output.

#### **Diagnostic Aid**

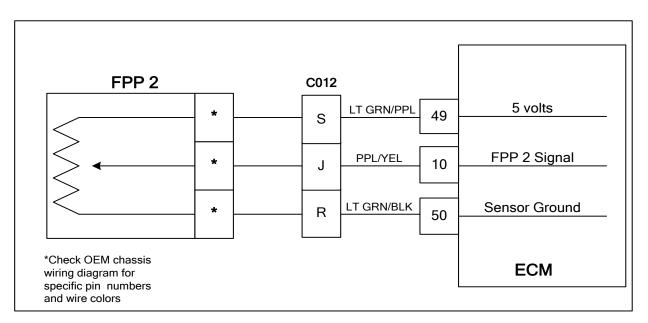

FPP sensors are OEM specific and vary in configuration. The exact wire color and pin numbers for the FPP must be verified in the OEM chassis wiring schematic. The FPP sensor used in this system provides two sensors in one packaged assembly. FPP1 and FPP 2 are not serviceable individually, and in the event of a failure the complete FPP assembly must be replaced.

## DTC 2127-FPP 2 Low Voltage (SPN 29:FMI 4)

## Conditions for Setting the DTC

- Foot Pedal Position
- Check Condition-Key On
- Fault Condition-FPP sensor voltage less than 0.400
- MIL-On
- Low Rev Limit
- Force Idle

## **Circuit Description**

The Foot Pedal Position sensor uses a variable resistor to determine signal voltage based on pedal position. This fault will set if the FPP 2 voltage is less than 0.200 volts at any operating condition while the key is on. If the voltage drops below 0.400 volts the FPP is considered to be out of specification. The MIL command is ON. Low rev limit and forced idle will be effect during this fault limiting power output.

#### **Diagnostic Aid**

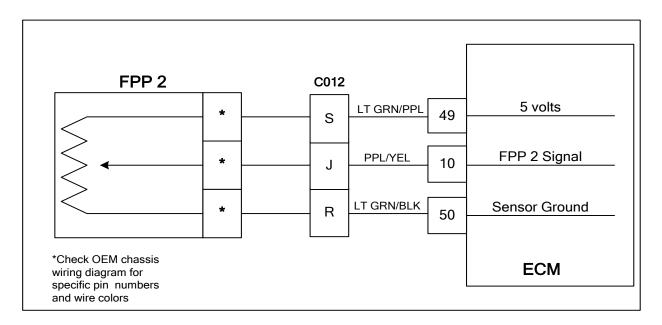

FPP sensors are OEM specific and vary in configuration. The exact wire color and pin numbers for the FPP must be verified in the OEM chassis wiring schematic. The FPP sensor used in this system provides two sensors in one packaged assembly. FPP1 and FPP 2 are not serviceable individually, and in the event of a failure the complete FPP assembly must be replaced.

## DTC 2128-FPP 2 High Voltage (SPN 29:FMI 3)

## **Conditions for Setting the DTC**

- Foot pedal position sensor 2
- Check Condition-Key On
- Fault Condition-FPP2 sensor voltage exceeds 4.800 volts
- MIL-On
- Forced idle
- Low rev limit

## **Circuit Description**

The Foot Pedal Position sensor uses a variable resistor to determine signal voltage based on foot pedal position. This fault will set if the FPP 2 voltage exceeds 4.800 volts at any operating condition while the key is on. If the voltage exceeds 4.800 volts the FPP is considered to be out of specification. The MIL command is ON. Forced idle and low rev limit will be in effect limiting power output during this fault.

#### **Diagnostic Aid**

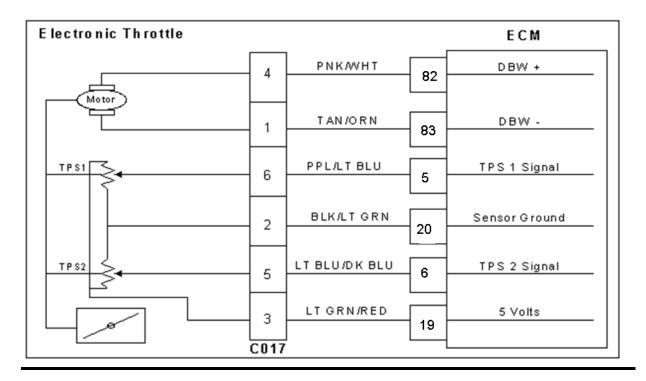

FPP sensors are OEM specific and vary in configuration. The exact wire color and pin numbers for the FPP must be verified in the OEM chassis wiring schematic. The FPP sensor used in this system provides two sensors in one packaged assembly. FPP1 and FPP 2 are not serviceable individually, and in the event of a failure the complete FPP assembly must be replaced.

## DTC 2135: TPS1/2 simultaneous voltages out-of-range (SPN 51:FMI 31)

## **Conditions for Setting the DTC**

- Throttle Position Sensor 1 & 2
- Check Condition-Key ON
- Fault Condition-TPS 1 20% higher than TPS2
- MIL-ON for remainder of key on cycle
- Engine shutdown

## **Circuit Description**

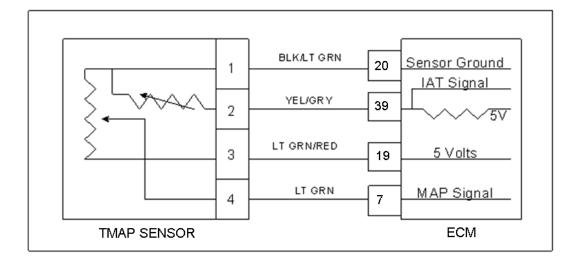

Dual throttle Position Sensors are used within the throttle that use variable resistors to determine signal voltage based on throttle plate position. TPS 1 will read lower voltage when closed and TPS 2 will read higher voltage when closed. The TPS 1 and TPS 2 percentages are calculated from these voltages. Although the voltages are different, the calculated values for the throttle position percentages should be very close to the same. The TPS values are used by the ECM to determine if the throttle is opening as commanded. The TPS is not serviceable and in the event of a failure the electronic throttle assembly must be replaced. This fault will set if TPS 1 is 20% (or more) higher than TPS 2. At this point the throttle is considered to be out of specification, or there is a problem with the TPS signal circuit. The MIL command is ON and the engine will shut down.

# DTC 2135: TPS1/2 simultaneous voltages out-of-range

# DTC 2229-BP High Pressure (SPN 108:FMI 0)

## **Conditions for Setting the DTC**

- Barometric Pressure
- Check Condition-Key ON
- Fault Condition-BP greater than 16 psia
- MIL-ON for active fault
- Adaptive-Disabled

#### **Circuit Description**

The BP (Barometric Pressure) is estimated from the TMAP sensor. The barometric pressure value is used for fuel and airflow calculations. This fault sets in the event the BP value is out of the normal range.

# DTC 2229-BP High Pressure

Step	Action	Value(s)	Yes	No
1	Did you perform the On-Board (OBD) System Check?	-	Go to Step (2)	Go to OBD System Check Sec- tion
2	<ul> <li>Key ON</li> <li>DST (Diagnostic Scan Tool) connected in</li> <li>System Data Mode</li> <li>Does DST display MAP pressure of 16 psia or greater?</li> </ul>		Go to Step (3)	Intermittent problem Go to Inter- mittent section

# Definitions

Air Valve Vacuum (AVV): The vacuum signal taken from below the air valve assembly and above the throttle butterfly valve.

**ADP:** Adaptive Digital Processor.

- **Air/Fuel Ratio:** The amount or balance of air and fuel in the air fuel mixture that enters the engine.
- **Analog Voltmeter:** A meter that uses a mechanical needle to point to a value on a scale of numbers. It is usually of the low impedance type and used to measure voltage and resistance.
- **Aromatics:** Pertaining to or containing the six-carbon ring characteristic of the benzene series. Found in many petroleum distillates.
- **Backfire:** Combustion of the air/fuel mixture in the intake or exhaust manifolds. A backfire can occur if the intake or exhaust valves are open when there is a mis-timed ignition spark.
- **Benzene:** An aromatic (C<sub>6</sub>H<sub>6</sub>). Sometimes blended with gasoline to improve anti-knock value. Benzene is toxic and suspected of causing cancer.
- **Bi-Fueled:** A vehicle equipped to run on two fuels. **Blow-By:** Gases formed by the combustion of fuel
- and air, which ordinarily should exert pressure only against the piston crown and first compression ring. When rings do not seal, these gases escape or "blow by" the side of the piston into the crankcase.
- **BTU:** British Thermal Unit. A measurement of the amount of heat required to raise the temperature of 1lb. of water 1 degree F.
- **Butane:** An odorless, colorless gas, C<sub>4</sub>H<sub>10</sub> found in natural gas and petroleum. One of the five LP gases.
- **CAFE:** Corporate Average Fuel Economy.
- CARB: California Air Resources Board.
- **Carbon Monoxide (CO):** A chemical compound of a highly toxic gas that is both odorless and colorless.
- **Carburetor:** An apparatus for supplying an internal-combustion engine a mixture of vaporized fuel and air.
- **Cathode Ray Tube:** A vacuum tube in which cathode rays usually in the form of a slender beam are projected on a fluorescent screen and produce a luminous spot.
- **Circuit:** A path of conductors through which electricity flows.
- **Closed Loop Operation**: Applies to systems utilizing an oxygen sensor. In this mode of operation, the system uses oxygen sensor information to determine air/fuel ratio. Adjustments are made accordingly and checked by comparing the new oxygen sensor to previous signals. No stored information is used.

CNG: Compressed Natural Gas.

CKP: Crankshaft Position Sensor

**CMP:** Camshaft Position Sensor

- **Conductor:** A material, normally metallic, that permits easy passage of electricity.
- **Contaminants:** Impurities or foreign material present in fuel.
- **Control Module:** One of several informal names for a solid state microcomputer which monitors engine conditions and controls certain engine functions; i.e. air/fuel ratio, injection and ignition time, etc. The formal name and the one used throughout this manual is ECM, or Engine Control Module.
- **Converter:** A LPG fuel system component containing varying stages of fuel pressure regulation combined with a vaporizer.
- **Cryogen:** A refrigerant used to obtain very low temperatures.
- **Current:** The volume or flow of electrons through a conductor. Measured in amperes or amps.
- DBW: Drive By Wire
- **Dedicated Fuel System:** A motor fuel system designed to operate on only one fuel type.
- **Diaphragm:** A thin, flexible membrane that separates two chambers. When the pressure in one chamber is lower than in the other chamber, the diaphragm will move toward the side with the low pressure.
- **Diaphragm Port:** The external port located at the fuel inlet assembly and connected to the vacuum chamber above the air valve diaphragm.
- DLC: Data Link Connector.
- **DTC:** Diagnostic Trouble Code
- **DST:** Diagnostic Scan Tool.
- **DVOM:** Digital Volt/ohm Meter. A meter that uses a numerical display in place of a gauge and is usually of the high impedance type.
- **ECT:** Engine Coolant Temperature.
- **ECM**: Electronic Control Module
- **ECOM**: A DLC cable supporting CAN and serial communication with a PSI/EControls ECM.
- **EFI:** Electronic Fuel Injection. A fuel injection system, which uses a microcomputer (ECM) to determine and control the amount of fuel, required by, and injected into, a particular engine.
- **EGO:** Exhaust Gas Oxygen, used to describe a sensor. Also known as "HEGO" (Heat Exhaust Gas Oxygen) sensor, "O<sub>2</sub>" or "Oxygen sensor.
- EGR: Exhaust Gas Recirculation.
- **EPA:** Environmental Protection Agency: A regulating agency of the Federal government which, among other duties, establishes and enforces automotive emissions standards.

**Ethanol:** Grain alcohol (C<sub>2</sub>H<sub>5</sub>OH), generally produced by fermenting starch or sugar.

- **Evaporative Emissions Controls:** An automotive emission control system designed to reduce hydrocarbon emissions by trapping evaporated fuel vapors from the fuel system.
- **Excess Flow Valve:** A check valve that is caused to close by the fuel when the flow exceeds a predetermined rate.

FTV: Fuel Trim Valve.

FFV: Flexible Fuel Vehicle.

- **Firing Line:** The portion of an oscilloscope pattern that represents the total amount of voltage being expended through the secondary circuit.
- **FMVSS:** Federal Motor Vehicle Safety Standards. **FPP:** Foot Pedal Position Sensor
- **Fuel Injector:** a spring loaded, electromagnetic valve which delivers fuel into the intake manifold, in response to an electrical input from the control module.
- **Fuel Lock:** A solenoid-controlled valve located in the fuel line to stop the flow when the engine stops or the ignition switch is off.
- **Gasohol:** 10 percent ethanol, 90 percent gasoline. Often referred to as E-10.
- **Gasoline:** A motor vehicle fuel that is a complex blend of hydrocarbons and additives. Typical octane level is 89.

GCP: Spectrum III (90-pin) ECM.

- **Greenhouse Effect:** A scientific theory suggesting that carbon dioxide from the burning of fossil fuels is causing the atmosphere to trap heat and cause global warming.
- HC: Hydrocarbon. An organic chemical compound.
- **HD 10:** A fuel of not less than 80% liquid volume propane and not more than 10% liquid volume propylene.
- **HD 5:** A fuel of not less than 90% liquid volume propane and not more than 5% liquid volume propylene.

HDV: Heavy Duty Vehicle.

- **Heavy Ends:** A term used to describe the build up of wax-like impurities that fall out of LPG when vaporized.
- **HEGO:** Heated Exhaust Gas Oxygen, used to describe a sensor. Also known as "EGO" (Exhaust Gas Oxygen sensor), "O<sub>2</sub>" or "Oxygen sensor.
- **Hg:** Chemical symbol for the element mercury. Used in reference to a measure of vacuum (inches of Hg).
- **Histogram:** The graphical version of a table which shows what proportion of values fall into specific categories over a specific period of time.

- **Hydrocarbon:** A chemical compound made up of hydrogen and carbon (HC). Gasoline and almost all other fuels are hydrocarbons.
- **Hydrostatic Relief Valve:** A pressure relief device installed in the liquid LPG hose on a LPG fuel system.

**IAT:** Intake Air Temperature

- **Ideal Mixture:** The air/fuel ratio at which the best compromise of engine performance to exhaust emissions is obtained. Typically 14.7:1.
- **Ignition Reserve:** The difference between available voltage and the required voltage.
- ILEV: Inherently Low Emission Vehicle.
- **Impedance**: A form of opposition of AC electrical current flow (resistance) measured in ohms.
- **Insulation:** A nonconductive material used to cover wires in electrical circuits to prevent the leakage of electricity and to protect the wire from corrosion.
- **Intercept:** An electrical term for a type of splice where the original circuit is interrupted and redirected through another circuit.
- **Knock:** Sound produced when an engine's air/fuel mixture is ignited by something other than the spark plug, such as a hot spot in the combustion chamber. Also caused by a fuel with an octane rating that is too low and/or incorrect ignition timing. Also called detonation or ping.
- Lambda Sensor: A feedback device, usually located in the exhaust manifold, which detects the amount of oxygen present in exhaust gases in relation to the surrounding atmosphere. (See HEGO).

LDV: Light Duty Vehicle.

- Lean Mixture: An air to fuel ratio above the stoichiometric ratio; too much air.
- **LEV:** Low Emission Vehicle.
- **Limp-in or Limp Home:** A mode where the ECM or a component has failed, but the vehicle remains operational although the engine may operate minimally. This term may also describe the drivability characteristics of a failed computer system.
- **Liquid Petroleum Gas (LPG):** A fuel commonly known as propane consisting mostly of propane  $(C_3H_8)$ , derived from the liquid components of natural gas stripped out before the gas enters the pipeline, and the lightest hydrocarbons produced during petroleum refining. Octane level of LPG is 107.
- **LPG**: Liquified Petroleum Gas.
- **M85:** A blend of gasoline and methanol consisting of 85% methanol and 15% gasoline.

Measurements of Pressure: 1 PSI=2.06" Hg

(mercury) = 27.72" H<sub>2</sub>O (water column). At sea level atmospheric pressure is 29.92" Hg.

**Methanol:** Known as wood alcohol (CH<sub>3</sub>OH), a light, volatile, flammable alcohol commonly made from natural gas.

MIL: Malfunction Indicator Lamp.

**Misfire:** Failure of the air/fuel mixture to ignite during the power stroke.

- **Mixer:** Fuel introduction device that does not include a throttle plate.
- **MFI:** Multiport Fuel Injection. A fuel injection system that uses one injector per cylinder mounted on the engine to spray fuel near the intake valve area of combustion chamber.
- **MSV:** Manual Shut-Off Valve. Refers to the manually operated valve on the LPG tank.
- **MTBE**: Methyl Tertiary Butyl Ether. Oxygenate add to gasoline to reduce harmful emissions and to improve the octane rating.
- **Multi-fuel System:** A motor fuel system designed to operate on two different fuels, such as LPG and gasoline.
- **Natural Gas:** A gas formed naturally from buried organic material, composed of a mixture of hydrocarbons, with methane (CH<sub>4</sub>) being the dominant component.
- **NGV:** Natural Gas Vehicle.
- **NOX:** See Oxides of Nitrogen.
- **OBD:** On Board Diagnostic
- **Octane Rating:** The measurement of the antiknock value of a motor fuel.
- **OEM:** Original Equipment Manufacturer, the vehicle manufacturer.
- **Open-Loop:** An operational mode during which control module memory information is used to determine air/fuel ratio, injection timing, etc., as opposed to actual oxygen sensor input.
- **Orifice:** A port or passage with a calibrated opening designed to control or limit the amount of flow through it.
- **Oscilloscope:** An instrument that converts voltage and frequency readings into traces on a cathode ray tube (also see Cathode Ray Tube).
- **Oxides of Nitrogen:** Chemical compounds of nitrogen bonded to various amounts of oxygen (NOX). A chief smog forming-agent.
- **Oxygen Sensor:** An automotive fuel system that produces a signal in accordance with the oxygen content of the exhaust gas. (See Lambda Sensor).
- **Oxygenate:** Oxygenates (such as MTBE, ethanol and methanol) added to gasoline to increase the oxygen content and therefore reduce exhaust emissions.

- **Ozone:** A radical oxygen module (O<sub>3</sub>) that is found in the upper atmosphere and filters out ultraviolet radiation from the sun. Ground level ozone is formed by NOX, during the formation of photochemical smog.
- **Particulates:** Microscopic pieces of solid or liquid substances such as lead and carbon that are discharged into the atmosphere by internal combustion engines.
- **Positive Crankcase Ventilation (PCV):** An automotive emission control system designed to reduce hydrocarbon emissions by routing crankcase fumes into the intake manifold rather than to the atmosphere.
- **Power Derate:** A mode of reduced engine power output for the purposes of protecting engine components during a failure or malfunction.
- **Pressure Differential:** The differential between atmospheric pressure and intake manifold (referred to as vacuum) pressure.
- **Pressure Regulator:** A device to control the pressure of fuel delivered to the fuel injector(s).
- **Primary Circuit:** The low-voltage or input side of the ignition coil.
- **Propane:** An odorless and colorless gas, C<sub>3</sub>H<sub>8</sub>, found in natural gas and petroleum.
- Psia: pounds per square inch absolute
- **PTV:** Pressure Trim Valve
- **Reactivity:** Refers to the tendency of an HC in the presence of NOX and sunlight to cause a smogforming reaction. The lighter the HC, the lower reactivity tends to be.
- **Regulator:** An assembly used to reduce and control the pressure of a liquid or vapor.
- **Resistance:** The opposition to the flow of current in an electrical circuit. Measured in ohms.
- **Rest Pressure:** Fuel pressure maintained within the system after engine shutdown.
- **Rich Mixture:** An air to fuel ratio below the stoichiometric ratio; too much fuel.
- **SAE:** Society of Automotive Engineers.
- Secondary Circuit: The high-voltage output side of the ignition coil.
- **SEFI or SFI:** Sequential Electronic Fuel Injection or Sequential Fuel Injection.
- **Sensors:** Devices that provide the control module with engine information as needed to properly control engine function.

- **Spark Line:** The portion of an oscilloscope pattern that represents the time during which the air/fuel mixture is being burned in the combustion chamber.
- **Splice:** An electrical term for the joining of two or more conductors at a single point.
- Stoichiometric Ratio: An ideal fuel/air ratio for combustion in which all of the fuel and most of the oxygen will be burned.
- **Sulfur Oxides:** Chemical compounds where sulfur is bonded to oxygen produced by the combustion of gasoline or any other fuel that contains sulfur. As sulfur oxides combine with water in the atmosphere to form sulfuric acid.
- **System Pressure:** The fuel pressure maintained in the system during normal engine operation.
- **Tap:** An electrical term for a type of splice where the original circuit is not interrupted.
- **TBI:** Throttle Body Injection. Any of several injection systems that have the fuel injector(s) mounted in a centrally located throttle body.
- **Throttle Body:** Controls engine RPM by adjusting the engine manifold vacuum to the mixer. Consists of a housing shaft, throttle liner and butterfly valve.
- TLEV: Transitional Low Emission Vehicle.
- **TMAP**: Combined Air Inlet and Manifold Pressure Sensor.
- **Toluene:** A liquid aromatic hydrocarbon  $C_7H_8$ . **TPS:** Throttle Position Sensor.

- **TSB:** Technical Service Bulletin.
- **ULEV:** Ultra Low Emission Vehicle.
- **USB:** Universal Serial Bus. A plug or interface supplied on most personal computers.
- **Vaporization**: A process in which liquid changes states into gas.
- Venturi Air Valve Vacuum (VAVV): An amplified air valve vacuum signal coming from the venturi area of the mixer, directly exposed to airflow before the addition of vaporized LPG.
- **Volt/ohmmeter** (VOM): A combination meter used to measure voltage and resistance in an electrical circuit. Available in both analog and digital types. May also referred to as AVOM and DVOM.
- **Voltage:** The electrical pressure that causes current to flow in a circuit. Measured in volts.
- **Voltage Drop:** A lowering of the voltage in a circuit when resistance or electrical load is added.
- **Voltmeter:** A meter that uses a needle to point to a value on a scale of numbers usually of the low impedance type; used to measure voltage and resistance.
- VSS: Vehicle Speed Sensor
- **Xylene**: C<sub>6</sub>H<sub>4</sub> (CH<sub>3</sub>)<sub>2</sub>. Any of three toxic, flammable, and oily isomeric aromatic hydrocarbons that are dimethyl homologues of benzene and usually obtained from petroleum or natural gas distillates.
- **ZEV:** Zero Emission Vehicle.
